PREFACE

On behalf of the organising committee, we are pleased to welcome you to the 11th Advances in Hospitality and Tourism Marketing and Management Conference co-hosted by the University of Mauritius and Washington State University, United States.

Following the success of the 10th Advances in Hospitality and Tourism Marketing and Management Conference in Italy, the 11th conference is held at the Ravenala Attitude, Mauritius. The goal of this scientific meeting is to provide an interactive forum for attendees from academia and industry to actively exchange, share, and challenge state-of-the-art research and case studies on hospitality and tourism marketing and management. The range of proposed topics of this conference reflects a number of major themes in hospitality and tourism marketing and management in Mauritius and internationally. You will see presentations and papers that examine a wide range of topics such as marketing, management, consumer behaviour, planning and development issues related to sustainability and the use of information technology. We strongly believe that contents of the presentations will significantly contribute to knowledge creation and dissemination pertaining to hospitality and tourism marketing and management among conference attendees.

The organising committee has spent countless hours to put this conference together. We would like to express our sincere gratitude and thanks to everyone who graciously volunteered their time and effort to organise this conference. We would like to extend our appreciation and sincere gratitude to the organising committee members who worked to ensure the quality of the papers and our keynote speaker Professor Haiyan Song, School of Hotel and Tourism Management, Hong Kong Polytechnique University. Without the organising committee members, volunteers and the help of international scientific committee, we would not have this conference.

On behalf of the organising committee, we would like to welcome you again to the 11th Advances in Hospitality and Tourism Marketing and Management Conference. We hope that you will enjoy the Mauritian hospitality while attending the conference and have a pleasant stay at the Ravenala Attitude Hotel.

The conference organising committee

Abstract

One way of addressing the negative effect of tourism is the imposition of tourist taxes. Accordingly, the purpose of this research is to look at the various forms of tourist taxes and the perceptions of tourists relating to effective tourist taxes in terms of their willingness to pay tourist taxes, the existence of a clear and precise legislation, the appropriate amount of tax to be collected and the uses of this tax money. The study explores the current of Mauritius where tourism has always been seen as among its key pillars that sustain its economy and helped it to flourish.

Key Words: Tourist taxes, Mauritius and departure taxes, tourists' perception on taxes, usage of tourist taxes, Mauritius and tourist arrivals.

1. Introduction

Tourism is among the fastest growing industries universally and apart from numerous jobs creation, the travel and tourism sector represented 9.2% of the share of global Gross Domestic Product (GDP) in 2023 (Statista, 2023). The growth of international tourist travels is expected to achieve a higher growth rate by 2024 accounting for 11.6% of world's GDP. This phenomenal rise indicates an opportunity for governments to use the tourism industry as an avenue to boost their revenue by establishing stronger fiscal systems. This is because a rise in tourist arrivals will normally necessitate an enhanced infrastructure in terms of physical investments like roads, networks, airports and for these purposes, a stream of financing is required.

In addition to financing infrastructural developments, it is commonly agreed by scholars that too much emphasis is laid on the economic benefits of the tourism sector whilst underpinning the social and environmental consequences (Alamineh et al., 2023; Brozovic and Saito, 2022; Postma and Schmuecker, 2017). Alongside, the implementation of sustainable solutions for tourism development is quite costly especially for the developing countries, thereby leading to frustrated local civilians with respect to the negative impacts on society, environment and resources. These effects may be translated in the form of air and water pollution, traffic jam, inflation, criminal offences, conflicting cultures among others (Alamineh et al., 2023). Consequently, it becomes imperative to address the negative impacts of the tourism industry by preventing, compensating and distributing the positive spill-over effects at the national level sustainably.

One way of addressing these concerns is the imposition of taxes in terms of tourist taxes which can take the form of hotel tax, visitor tax, aviation tax and departure tax. Basically, the UNWTO (1998) defines tourism taxes as "applicable specifically to tourists and the tourism sector, or alternatively, if not specific to the tourism sector, those which are applied differently in tourist destinations. However, while some countries across the globe have established the appropriate legal framework in establishing the tourist taxes, their uses and impacts on tourism development remains unverified. Primarily, it is important to understand the perspectives of tourists regarding the imposition of these taxes and their main uses since it will be unfair to collect taxes from someone who does not have transparency or a say in how their money is being utilised. Accordingly, the purpose of this paper is to look at the various forms of tourist taxes and the perceptions of tourists relating to effective tourist taxes in terms of their willingness to pay tourist taxes, the existence of a clear and precise legislation, the appropriate amount of tax to be collected and the uses of this tax money by the authorities.

The study explores the current of Mauritius which is an island destination located in the Indian Ocean where tourism has always been seen as among its key pillars that sustain its economy and helped it to flourish. For example, tourism contributed 8% GDP in year 2019 (Statistics Mauritius, 2019) and according to the Ministry of Tourism, tourist arrival increased at a rate of 9% each year and it has analysed that the tourism sector is expecting a rebound in tourist arrival after the covid pandemic and a revival growth of 6.7% has been seen in 2022 and a further growth of 4% is expected in 2023 (Export Enterprises, 2022). In fact, successive governments have successfully made the tourism industry meet international standards and in this way more tourists are attracted and to come in the island each year. However, Mauritius was ranked 16th among the highest disaster risk countries by the 2018 World Risk Report. (UNEP, 2019) This poses an alarming pressure on public authorities to implement policy instruments which address the causes and the consequences of natural disasters. Amongst the plethora of measures available, taxation policies can be considered to have the most structural influence, having the capacity to alter the macroeconomic dynamics. Several environmental taxation measures have been implemented in Mauritius's legislations, mainly in the Income Tax Act 1995, but also the Excise Act 1994 and the Value Added Tax Act 1998. In this respect, the existing taxes concerning the tourism sector will be assessed and the perceptions of tourists who visit Mauritius will be investigated.

In order to achieve these research objectives, the black-letter research method was employed which comprised of the legal analysis of provisions surrounding tourist taxes in order to collect secondary data. Additionally, some 25 tourists were targeted to conduct a semi-structured interview, particularly those who have visited Mauritius and have stayed at least one night in the country.

At present, this study is amongst the first academic writings on tourist taxes in the context of Mauritius and it is being carried out with the aim of combining a large amount of empirical, theoretical, and factual information that can be of use to various stakeholders and not only to academics. One early study conducted by Gooroochurn and Sinclair (2005) investigated the types, objectives, principles and effects of tourism taxation in Mauritius. However, the perception of tourists who visit Mauritius on tourist taxes has not yet been studied by existing literature, an area to which this existing research intends to fill in the gap. This research is relevant since the findings will help the Mauritian policy makers to better assess the most appropriate forms of tourist taxes as well as their optimum amounts which will increase governmental revenue on one side whilst reducing the negative implications on tourist demands on the other hand.

While the first section of the paper has introduced the background of the research, the objectives, the research methods to be adopted and the originality of this study, the other parts of the paper are structured as follows: Section 2 discusses the various types of tourist taxes and some studies conducted by several distinct scholars on the concept of tourist taxes. Section 3 elaborates on the research methodology while Section 4 presents the findings of the interviews conducted. Section 5 compares the related laws on tourist taxes in different parts of the world and Section 6 suggests recommendations for the Mauritian stakeholders on the researched topic and concludes the research.

2. Literature Review and Tourist Taxes in Mauritius

2.1 Literature Review

Tourist taxes target specifically visitors and are imposed by the host country. These taxes may take various forms among which is the lodging tax also known as the accommodation tax, which is levied by countries such as Italy, Dubai and Ireland on the providers of accommodation. The accommodation providers then pass on this tax on tourists by adding this additional cost onto the room price (Rotaris and Carrozzo, 2019). The intent behind the imposition of these taxes is to protect the local community and remedy any wrong caused by the tourism sector by using funds collected by the same tourism industry. The lodging tax may either be a fixed amount prescribed by the legislation or an ad valorem amount which represents a percentage value of the room price paid by the visitor on aggregate. In fact, the accommodation tax is an indirect one which is easily collected and passed on by accommodation operators to the revenue authority of the respective country.

Additionally, departure or aviation taxes are also imposed on all tourists leaving a particular destination regardless of whether they are foreign visitors or local residents, and they are collected by airlines or shipping operators. This tax is usually included in the passenger air ticket price and remitted to the revenue authority of the destination country. The amount varies depending on the travel distance or the greenhouse gas emissions by the airplane. However, some scholars like Goktas and Cetin (2023) believe that if the aviation tax is a fixed amount, then it is discriminatory towards those who travel short distance and accordingly, the imposition of this tax needs to be treated with caution.

The impact of tourist taxes has been studied by various scholars since the 1970s. Essentially, there is a presumption that these taxes will reduce the number of visitors in a particular country and economic growth of the relevant jurisdiction will be affected negatively. However, this presumption is debatable since some more recent studies have found that tourist demands tend to be inelastic and hence, tourist taxes do not have negative impact on tourist arrivals. For instance, Fujii e al. (1985) analysed the effect of imposing tourist taxes in Hawaii by using the time series method. the findings showed that a room tax led to inelastic demand leading to no significant adverse impact on hotel revenue.

Furthermore, Dodds et al. (2010) and Valle et al. (2012) assessed the impact of tourist taxes in Indonesia and Portugal respectively. Dodds et al. (2010) found that tourists are ready to abide by the measures imposed by the government of the host country to foster sustainable development and prevent environmental harm amongst which is the payment of tourist taxes to finance these measures. Similarly, Valle et al. (2012) concluded that a vast majority of tourist are aware of the environmental consequences of visitors in the host destination and are agreeable to pay accommodation taxes for environmental restoration and protection.

Nevertheless, a tourist tax may reduce tourist arrivals and demand if the tax money is not used as per the expectations of visitors or to support the location's attractiveness (Rotaris and Carrozzo, 2019; Duran-Roman, 2021; Sethy and Senapati, 2023). This is because there are competing destinations which may be utilizing the funds in the proper manner according to tourists' preferences and hence, they are good substitutes which will induce a shift in demand, thereby leading to economic loss to those countries which are unable to manage tourist taxes appropriately. As such, the positive effect of tourist taxes will only be experienced if tourists are willing to pay the tax primarily which in turn relies on whether the tax is designed correctly, the amount of tax is determined with clarity and precision, the optimal tax amount and expected usage of funds as per tourist preferences are given due consideration (Emil and Dolnicar, 2014; Sethy and Senapati, 2023). In this line, Cetin et al. (2017) investigated tourists' preferences to pay taxes in Turkey and they averred that they would still visit the country even if their total cost increased by one-third provided that this money will improve their experience in terms of destination sustainability. Also, Notaro et al. (2019) assessed the willingness of tourist to pay tax for the protection of the eco-systems in Italian Alps and again, the findings demonstrated the positive attitude of tourist towards these taxes due to its clear legislation and sustainable usage. The same findings were noted by Sethy and Senapati (2023) who assessed the multiple stakeholders' perceptions about the existing problems and benefits in ecotourism practice. They noted that tourists are willing to pay taxes for ecotourism development and biodiversity conservation in natural preserved areas.

As elaborated by the existing literature on the researched topic, several factors need to be considered in designing an efficient tourist tax one among which is the perception of tourists in terms of the usage of this tax and the tax amount as well. At present, no research has been done concerning the willingness of tourists who visit Mauritius to pay tourist taxes, for which this existing study intends to filling in the gap in literature. Consequently, this research aims at testing the theoretical framework developed by eminent scholars like Emil and Dolnicar (2014), Cetin et al. (2017), Notaro et al. (2019) and Sethy and Senapati (2023) by investigating the same for the Mauritian context, as more clearly illustrated in the below Figure 1:

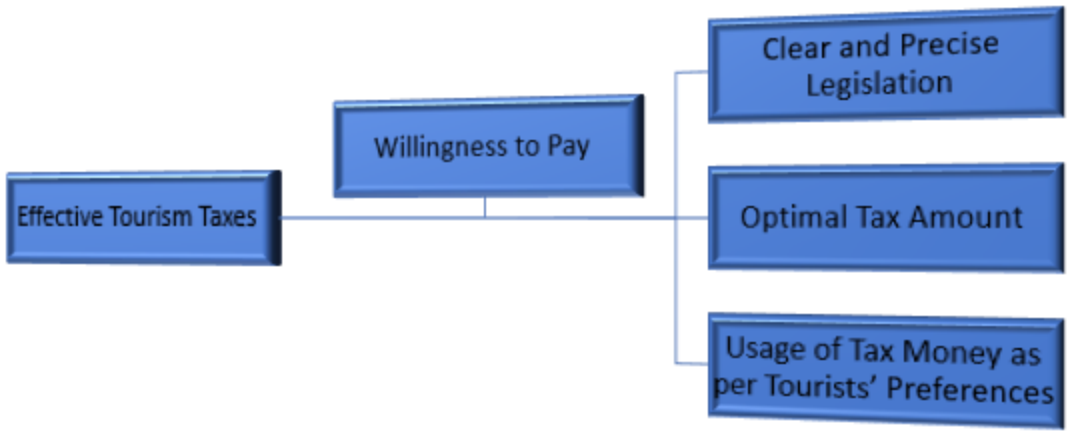

Figure 1: Theoretical Framework for Effective Tourist Taxes (Authors Self-Generated)

2.2 Tourist Taxes in Mauritius

Concerning the types of tourist taxes in Mauritius, the Civil Aviation Act 1974 (Act No. 15 of 1974) (CVA) provides for the payment of passenger fee and passenger solidarity fee by every passenger departing from Mauritius by air. Basically, Section 8A of the CVA imposes an obligation on every airline operating in Mauritius to charge the passenger fee to anyone leaving Mauritius, the amount of which is specified in the Second Schedule of the Act which is detailed in Table 1 as follows:

Age	**Passenger whose journey originally starts from Reunion Island, Madagascar, Seychelles or Comoros**	**Any other passenger**
Below 2 years	Nil	Nil
Between 2 to 12 years	USD13	USD30
Above 12 years	USD35	USD60

Table 1: Amount of Passenger Fee in Mauritius (Authors Self-Generated)

However, there are some persons who are exempted to pay the passenger fee, the description of which are set out in the First Schedule of the CVA as follows:

- heads of State and their families,
- passengers in transit for less than 24 hours,
- airline crew members who are on duty,
- ministers of foreign governments and their families, ambassadors or commonwealth representatives and their families, United Nations representatives and other agencies having agreements with Mauritius in this regard.

Additionally, there is also a passenger solidarity fee levied on all passengers departing from Mauritius by air and this is collected by the respective airline operating in Mauritius. The amount of this tax is mentioned in the Third Schedule of the CVA and is of USD1 for a passenger travelling in economy class, and USD2 for any other passenger.

The airline operator has a period of 30 days from the end of each month to remit the tax to the Mauritius Revenue Authority (MRA) together with a statement certifying the class and number of passengers in respect of that air flight. Failure to do so amounts to the imposition of a penalty of 5% of the fee and interest at the rate of 1% on any amount not remitted up to the date of payment. In fact, both the passenger fee and passenger solidarity fee may be termed as departure or aviation taxes since they are levied either at the time of issue of the travel ticket, confirmation of a reservation held by the traveler or at any time before the latter leaves Mauritius. Nevertheless, neither the CVA nor the

Hansard (parliamentary debates over the enactment of a legislation) mentions the use of these departure taxes which makes it difficult to figure out the original intention of the legislator in establishing these taxes. This represents a lack of transparency regarding the tourist taxes in Mauritius, which is an essential component behind an efficient tax system as evidenced by existing literature mentioned earlier in this paper.

3. Research Design

The main research objective of this study is to assess the perceptions of tourists on tourist taxes in Mauritius. Basically, existing studies suggest that an effective tourist tax relies on the willingness of tourists to pay the tax otherwise, tourists' demand for Mauritius will fall due to the existence of alternative competing destinations, thus impacting on the Mauritian economy negatively (Dodds et al.,2010; Valle et al., 2012). In turn, the willingness of tourists is heavily dependent on three main factors being the design of a clear and precise legislation, the optimal tax amount and expected usage of the tax money (Emil and Dolnicar, 2014; Cetin et al., 2017; Notaro et al., 2019).

According to the theoretical framework formulated for this research as illustrated in Figure 1 above, 5 questions were formulated based on existing literature on tourist taxes mentioned in Section 2 above and taken from the studies conducted by Dodds et al. (2010), Valle et al. (2012), Emil and Dolnicar (2014), Cetin et al. (2017) and Notaro et al. (2019). These questions were designed with the view of addressing the 5 scopes of this existing study with the first dimension concerning tourists' perception on effective tourist taxes, the second one investigating the willingness of tourists to pay taxes, the third one on the requirement for a clear and precise legislation, the fourth one on an appropriate amount of tourist tax and the fifth one on the expected usage of tourist taxes by the destination government.

The interviews comprised of 2 major components, the first one investigating the profile of the respondents. Age was deemed necessary to ask since a particular question was targeted to those above 12 years old for the passenger fee amount. Nationality was also important to examine so as to ensure that the interviews do not include responses from any Mauritian citizens since only foreign tourists are targeted for this existing research. Additionally, the length of stay of each interviewee was inquired to ensure that they have stayed for at least 24 hours in Mauritius. Thereafter, the second component of the interview comprised of a series of 5 questions to assess tourists' perception of tourist taxes in terms of (1) their effectiveness, (2) the willingness to pay, (3) the related legislation, (4) the optimal tax amounts and (5) the uses of these tax monies. Basically, the questions presented to the interviewees are as follows:

1. To what extent to you believe that tourist taxes are effective?
2. You are paying taxes when you depart from Mauritius by air flight. Do these taxes represent a huge proportion of your total travel cost? If these expenses were voluntary payments, would you still be paying the departure costs?
3. What is the role of an act of parliament concerning tourist taxes?
4. You are paying USD60 as passenger fee and a maximum of USD2 as passenger solidarity fee when leaving Mauritius. Would you still come to Mauritius if these rates were increased to USD120 and USD4 respectively?
5. If you form part of the government of Mauritius, what would you do with the money raised from tourist taxes?

Mauritius has welcomed more than 1 million of tourists for the year 2023 and it is impracticable to interview all these tourists due to time and resource constraints. Consequently, it was decided to perform random sampling to identify the interviewees. There are at present 112 hotels licensed by the Tourism Authority of Mauritius (Tourism Authority, 2023) and 25 of these hotels which are most closely located to the researchers in terms of location/physical proximity, were contacted to conduct the interview at their places. As such, a particular day and time was scheduled to interview one tourist from each 25 hotels, which corresponds to a target population of 25 tourists. A timeline of one month that is, the whole month of January 2024 was selected to conduct the interviews.

4. Research Findings

During the interview process, the respondents were briefed about the objective of the research and they were reassured that the responses and their identities will remain confidential and anonymous. On average, each interview lasted for around 30 to 45 minutes and of the 25 tourists approached during the month of January 2024, 16 of them agreed to respond to the 5 questions on tourist tax. The response rate thus stands at 64%, a figure which Holtom et al. (2022) qualified as good enough to proceed with the analysis of results.

4.1 Profile of Interviewees

The interviews started with 3 questions on the age, nationality and length of stay in Mauritius of each respondent. The findings are illustrated in the below Table 2:

Respondent	Age (years' old)	Nationality	Length of Stay (days)
INT1	36	Indian	10
INT2	56	British	7
INT3	20	British	7
INT4	57	Indian	15
INT5	23	American	21
INT6	45	American	15
INT7	22	Indian	7
INT8	19	Indian	7
INT9	65	Australian	12
INT10	66	French	21
INT11	54	South African	15
INT12	35	South African	12
INT13	26	Canadian	9
INT14	45	Swiss	7
INT15	50	French	6
INT16	48	French	5

Table 2: Profile of Interviewees (Authors Self-Generated)

Table 1 above shows that all the interviewees are above the age of 12 which implies that they have paid the passenger fee each. Moreover, all of them are age of 18, which makes it a reliable target group since it is presumed that they are aware of the concept of tax and they are in a better position to provide an informed opinion on the researched topic. Table 1 also illustrates that all the interviewees are from foreign countries aside Mauritius, and it is noted that they are from various regions across the globe which enables this paper to capture the diversified views of different nationalities. The length of stay for each respondent exceeds one day (24 hours) which ensures that they have paid both types of tourist taxes in Mauritius, an essential criterion that enables the respondents to be in an ideal position to answer the interview questions.

4.2 Analysis of Interview Results

Following the demographic questions, the interview proceeded with 5 questions developed from the theoretical framework established in Section 2 of this paper encompassing the following dimensions: effective tourist taxes, willingness to pay, clear and precise legislation, optimal tax amount and usage of tax money. The findings were hand-written for better clarity and also to avoid any confusion at the time of the analysis. Thereafter, the transcripts were summarised using themes through the in-vivo coding method. More specifically, the interview results were scrutinised and compared among the responses obtained for the purpose of identifying and gathering conceptual similarities, patterns and themes.

4.2.1 The Effectiveness of a Tourist Tax

The first question aimed at assessing the perception of tourists on the effectiveness of tourist taxes. The majority of the respondents (12 of the 16) are of the opinion that tourist taxes are effective if they are used in a proper manner and channeled to the appropriate projects. Essentially, 7 particular interviewees (INT2, INT3, INT4, INT6, INT12, INT15 and INT16) mentioned that the objective behind imposing a tourist tax is to remedy or prevent any wrong occurring to the environment or the society arising from tourism activities. In this respect, they believe that a tourist tax is only effective if the environment is protected from this money or any societal concern is minimised upon the imposition of such taxes.

Furthermore, some other respondents (INT1, INT5, INT7, INT8 and INT9) are of the opinion that tourist taxes are beneficial if the government of the host country is able to re-invest this money to render the tourism industry more attractive and lucrative. Some examples were provided by the interviewees like the enhancement of road and telecommunication networks, improvement of recreational parks and tourists attractions, the provision of free medical facilities to tourists, the provision of governmental subsidies to taxi drivers for tourists who use these services, the removal of value added tax on food products consumed by tourists.

For the other 4 interviewees, some mixed responses were obtained to the effect that on one hand, they agree that tourist taxes will help in reducing the negative impacts on the environment and society, and may help in developing the infrastructures of a country but on the other side, they stated that tourist taxes are simply a means of generating additional revenue to the government. These respondents averred that the tourist tax revenue is used to finance the achievement of some political aspirations or promises made during the election campaigns, and because they cannot impose this cost on the local population for fear of losing votes, they transfer this additional expense to foreigners in the form of passenger fees or accommodation taxes. They in turn mentioned that it is unfair to pay taxes to finance projects that not of concern to them and they feel helpless because they cannot escape such taxes. Additionally, one of the interviewees believes that the international tourism industry is quite competitive and hence, imposing additional expenses on to tourists will render the host country less appealing for destination and this will decrease international arrivals in the country which in turn may affect its gross domestic product. For these respondents, it is clear that tourist taxes are not effective since they consider these taxes to be double-edged swords.

4.2.2 The Willingness to Pay Tourist Taxes

The interviewees were firstly briefed about the departure taxes that they usually pay when leaving Mauritius and they were asked if these taxes represent a large portion of their total travel costs. A follow-up question was also presented to investigate if the tourists will still be paying these departure expenses if they were purely voluntary.

It is noteworthy to highlight that all the 16 interviewees stated that the departure taxes accounted for an insignificant portion of their total travelling costs. Thereafter, a consistency pattern was noted for the follow-up question against the first interview query. In fact, the 12 interviewees who opined positively on the effectiveness of tourist taxes, are willing to pay the departure costs on a purely voluntary basis if these were not provided by a legislation. In contrast, the 4 interviewees who had mixed feeling about the efficiency of tourist taxes, mentioned that they would not have paid the departure costs had these been not compulsory taxes.

Consequently, these findings corroborate existing studies that conclude the existence of a positive relationship between the perceived effectiveness of tourism taxes and the willingness to pay (Rotaris and Carrozzo, 2019; Duran-Roman, 2021; Sethy and Senapati, 2023).

4.2.3 The Existence of a Governing Law

The interviewees were then asked about the role of an act of parliament in establishing tourist taxes. All the 16 respondents perceive a governing tourist tax legislation to be of crucial importance since it determines the amount of levies imposed on people visiting a country and INT3 avers that where money is involved, people need to have some reassurance in terms of transparency and clarity. A tourist tax law also avoids misinformation and inconvenience for tourists to inquire about the relevant taxes to be paid when travelling to the destination country (INT5, INT9 and INT10).

Apart from acknowledging the correct amount of tourist taxes and to whom these shall be paid, some other responses received from the interviewees highlights the importance of having a system and framework which imposes punitive taxes or penalties such that this related legislation will help people doing research on their travelling decision. This act of parliament may also give tourists incentives and strategies to cut down unnecessary travelling.

INT12 and INT16 both mentioned that a tourist tax legislation enables the government to encourage mass tourism on one hand and on the other hand, control the environmental and social consequences of this phenomenon. In particular, being aware of governmental policies on tourism will ensure a proper monitoring of the control mechanisms established to safeguard the interests of both tourists and the host country. They believe that an efficient piece of tourist tax legislation shall not only include information on the amount and frequency of taxation levies but must also refer to monitoring responsibilities and sanctions to foster tourism development.

4.2.4 The Optimal Amount of Tourist Taxes

Another question presented to the interviewees relates to the amount of tourist taxes that visitors are willing to pay when coming to Mauritius. Basically, each respondent was briefed on the actual amount of tourist taxes that is USD60 as passenger fee and USD2 as the passenger solidarity fee and they were asked if they will still be visiting Mauritius if these rates were doubled.

All the respondents confirmed that the rise in passenger fees by 100% will not affect their travel decision and they will still be coming to Mauritius. Some interviewees are in fact in favour of an increase in tourist taxes by mentioning that the Mauritian currency is quite low as compared to other currencies and the net impact on tourists' total travel cost will still be small. They believe that this increase will not threaten tourists' arrivals and they construe it as beneficial since the Mauritian government will have more money to invest in tourist facilities which will render tourists' experience more appealing. In return, the tourism sector will flourish and hence the country will experience a positive economic impact.

It is worth to highlight that the interviewees' perceptions are however different from the conclusions of previous studies that sought to assess the impact of an increase in tourist taxes. For instance, Emil and Dolnicar (2014) found that increases in taxation have been directly correlated to a weakening of demand from tourists.

4.2.5 The Expected Usage of Tourist Taxes

The main objective of this research is to assess tourists' perception on tourist taxes and an effective fiscal system is one which meets the usage expectations of visitors in a country (Notaro et al., 2019; Sethy and Senapati, 2023). Accordingly, the interviewees were asked about those areas that need investments from the tourist taxes collected if they had the decision-making power of the country concerned. All the interviewees have suggested at least one usage of the tourist taxes, the answers of which have been summarised hereunder.

3 interviewees answered that law, order, peace and security of the destination country are quite important to ensure favourable holidays and memories and they would expect the fiscal monies to be channeled in projects that deter violence such as robbery, attacks, violent political events. INT4 also mentioned that he would invest the money in alleviating the problem of traffic congestion in Mauritius since he quotes: "*I am here to enjoy my time which has to be optimised in an efficient manner rather than losing time in waiting and remaining idle looking at the traffic*".

Some other respondents believe that the tourist taxation money must be used to enhance tourist-related infrastructures such as an improvement is required for the SSR Botanical Garden in terms of its cleaning and maintenance (INT6) and road signs must be improved for tourists since the majority of them seem stolen or damaged (INT8, INT9, INT10). The interviewees also mentioned that tourist taxes may be used to establish some additional recreational facilities such as parks, theme parks, festivals, seaside activities, free Wi-Fi and the provision of tourist guides at no cost. These would indeed contribute to a better tourist experience. They believe that these advantages will make the country more appealing to tourists and by extension, the number of international travelers to the country concerned will increase. The domino effect will be a rise in economic growth and living standards which in turn justifies the effectiveness of tourist taxes.

Moreover, few tourists (only 4) believe that the taxes may be utilised for any environmental restoration project such as coral reefs preservation, marine animals' protection, improvement of air quality, capture of rainwater to reduce water shortage in low rain seasons. Very few (only 2 interviewees) mentioned that the tax money can be used to relieve poverty in the country since they have come across beggars living in dire economic situations and the government can use this money to empower them.

Accordingly, based on the interview's responses, the expected uses of tourist taxes can be grouped into 4 categories into (1) the deterrence of violence, (2) infrastructural development and enhancement, (3) environmental restoration, and (4) community enhancement.

5. Discussion and Conclusion

As mentioned earlier, Mauritius relies extensively on the tourism industry for growth and economic development. In this respect, the main tourist products in Mauritius are its natural environment, heritage, culture and people. Accordingly, while on one side, these attributes have to be preserved and taken good care of, on the other side, financial resources are required to render the Mauritian tourist industry more attractive. Climate change effects including natural disasters and global warming have all prompted stakeholders to acknowledge the importance of sustainable development by catering for people, planet and profit. This explains the fact that several countries across the globe have established tourist taxes including Mauritius in order to obtain funds to compensate the sustainability of tourism development.

This research has assessed the various forms of tourist taxes and the perceptions of tourists who have visited Mauritius and have paid these taxes. In fact, the positive effect of tourist taxes will only be experienced if tourists are willing to come to the destination country and pay the tax, the willingness of which in turn relies on several factors established by existing studies. These were identified as the readiness to pay, the existence of legislation, the perceived optimal tax amount and the perceived uses of tourist taxes (Emil and Dolnicar, 2014; Sethy and Senapati, 2023; Cetin et al., 2017). The findings of this interview will definitely help the Mauritian stakeholders concerned with valuable feedback on how to better design tourist taxes in terms of their imposition and usage.

Tourist taxes are special forms of taxes that are expected to be spent on tourism related expenses by the local government, which implies that there is a restriction on the manner in which these monies are used. This was confirmed by the findings of this study. In particular, tourists are willing to pay more tax if their experiences are improved in terms of better infrastructure and facilities. Surprisingly, less than the majority of the 16 interviewees (only 6) mentioned the sustainability usage as the main objective of tourist taxes, a result which somehow contradicts the findings of existing studies of Emil and Dolnicar (2014), Cetin et al. (2017) and Notaro et al. (2019). It is therefore perceived that tourist taxes must be used for tourists' facilities and for the betterment of tourists' experiences. Nevertheless, the sustainability of any destination is crucial for the long-term success of the tourism industry in general. If the environment and people aspects are neglected, the tourism sector will not be able to regulate itself in isolation and thrive. Indeed, no single category of stakeholder is responsible to cater for sustainability, it is the role of each and every one of us including government, civilians, foreigners among others.

The findings of this study also conclude that tourists are willing the departure taxes even if these were voluntary provided that they are guaranteed with certainty as to where these monies are invested. This result corroborates with the conclusion of Cetin et al. (2017) about tourists' willingness to pay taxes. Moreover, all the tourists interviewed confirmed the importance of a governing tax legislation which ensures clarity and transparency. A proper piece of the related tourist tax legislation avoids misinformation and inconvenience for visitors.

Additionally, tourists are aware that they are creating economic benefits further to the taxes paid and they are ready to pay more provided that a proper usage of this money is made. This finding is different from the studies of Emil and Dolnicar (2014) who found that increases in taxation have been directly correlated to a weakening of demand from tourists. Nevertheless, the study was conducted in 2014 and 10 years' later in 2024, it is assumed that a change in mindset and practices has led to a more positive perception of a rise in tourist taxes.

Lastly, the main 4 categories of expected usage of tourist taxes are grouped into the deterrence of violence, (2) infrastructural development and enhancement, (3) environmental restoration, and (4) community enhancement. However, although tourists' perspectives should be considered, the experience of a wider stakeholder group involving the local government, local NGOs, civilians, regulatory bodies and the tourism operators, is required to administer, collect and use the tax money in a more efficient and democratic manner to mange tourist taxes. An accommodation tax can also be used to regulate the negative effects of tourism in Mauritius but policy makers must be careful in designing tax reform since a sudden and major increase in tourist budget can be detriment to tourist arrivals in the country. Accordingly, future scope of research may stress on contemplating the enactment of an accommodation tax law taking into consideration its potential effect on the Mauritian economy.

Conflict of Interest

The authors declare that there is no conflict of interest to be declared in this research.

STUDY OF BRAND POSITIONING TO PROMOTE TOURISM DESTINATIONS: IMPLICATIONS FOR KIDEPO VALLEY NATIONAL PARK

Shifa Wahab

Islamic University in Uganda (IUIU)

Mbale, Uganda

ABSTRACT

It's surprising to learn that Kidepo Valley National Park (KVNP), which is widely regarded as Africa's best park with stunning scenery, receives the lowest number of visitors. Despite its potential as a major tourist attraction, it is still relatively unknown to many people. A descriptive approach is used to explain how the AIDAR model can be applied to promote tourism destinations. However, further practical research is needed to realize the benefits of effective brand positioning in the tourism industry. This study contributes to understanding the implication of brand positioning for tourism destinations to achieve sustainable competitive advantage.

Keywords: *Brand positioning, AIDAR model, destination, descriptive*

INTRODUCTION

Successful destination promotion necessitates setting an environment that allows the public to value what the destination has to give to visitors. That environment creates the overall brand image of the destination. As the tourism industry slowly recovers from the Covid 19 pandemic, it is estimated that there will be increased capacity of international tourism especially to the Middle East, Africa, and Eastern Europe which are seen as emerging markets. One approach to address the likely increase in visitor numbers is to have destinations clearly define their brand identity. Therefore, creating a brand image that resonates with the major stakeholders to allow the destination to stand out becomes key.

According to (Eckert and Zagere,2021), wide research and consultation are needed to identify the major external and internal factors that affect the destination and consumers' perception of it and the general view of the community. This will enable building a branding that is in line with stakeholders' interests.

Kotler and Keller (2006, p. 310), define brand positioning as "the act of designing the company's offering and image to occupy a distinctive place in the mind of the target market". This therefore implies that; to achieve effective destination brand positioning, the destination should have unique features that are appealing to potential visitors. Positioning creates a reason why customers should prefer the brand over others. Kotler emphasizes that the outcome of positioning is the successful creation of a customer-focused value proposition, which persuades the target market to buy the product. Effective destination branding that is sustainable will ensure competitiveness, dynamism, innovativeness, and agility to the changing industry drifts resulting in increased progress in the tourism industry.

Africa as a continent has a very rich culture, history, and traditions with massive natural resources from exceptional wildlife and magnificent landscapes to its inspiring natural wonders. Despite having such resources, the continent has not yet fully harnessed its tourism potential due to factors such as insecurity, poor and inadequate infrastructure, and inadequate marketing and promotion of tourism (Bishar and Robertine, 2023). This has made many countries in Africa struggle to compete with other continents such as Europe, America, and Asia in the tourism industry. Yet it has been

projected that the Middle East, Africa, and Eastern Europe are newly emerging tourism markets whose growth will depend on many factors related to progress, conflict resolution, and cultural developments and that by 2030 these emerging destinations will see more rapid growth than the more developed ones (Fyall et al, 2019).

Destination Background

Kidepo Valley National Park (KVNP), which is found in Kaabong district in the Karamoja region in Northeastern Uganda, has 1442 square kilometers, with rugged savannah, Mount Morungole and divided by the Kidepo and Narus rivers; is among the untouched and least disturbed of Africa's wildernesses, and is considered Africa's best parks with the most good-looking landscape https://www.eastafricantrails.com/kidepo-valley-national-park/. It is the most remote national park in Uganda and is one of the best virgin places every wildlife viewer can ever visit. The few who have visited the park through the wild frontier region of Karamoja acknowledge that it is also the most wonderful, as it ranks among Africa's finest wildernesses. (https://ugandawildlife.org/tours/kidepo-valley/. The park hosts 470 bird species and manages a wider diversity of animals with 80 mammal species; 28 of which cannot be found in any other park in Uganda. These include; Cheetah, Caracal, Aardwolf, Stripped Hyena, Bat-eared Fox, and Hunting dogs which are carnivore species unique to this region and protected within KVNP https://www.eastafricantrails.com/kidepo-valley-national-park/. The park stands as a true description of tourism in Uganda but is still unknown to many (https://www.kideponationalpark.com). This therefore creates an opportunity for the Uganda Wildlife Authority (UWA) to brand Kidepo as a high-value destination that offers exceptional wildlife among other things. The richness of Kidepo in terms of flora and fauna creates an opportunity to position it as a 'Nature Positive' destination.

Successful branding and promotional strategies have been developed to promote tourism in the Karamoja region for example "Discover Karamoja", Uganda's best-kept secret tells the story of how the region' unique amalgamation of people, activities, and landscape cannot be found in any other part of the world. This campaign which is aimed at developing and marketing the region as an attractive tourist destination is in partnership with the Government of Uganda and the private sector tourism industry. However, no specific branding strategies have been developed to promote Kidepo Valley National Park which is amongst the best wildlife destinations in Africa.

The motivation for writing this paper is formed by several factors which are intertwined leading to the trend in the tourism industry which include: the increasing number of retired persons who have the desire and energy to travel; rise in unrestricted time i.e. shorter work weeks and more vacations; the growing movement of the international tourism market; the changes in consumer preferences and expectations of global tourists; the increasing international competition of global tourists; the growing importance of tourism in stimulating the growth of nations' welfare and the increasing tactical importance of macro-marketing whereby many nations worldwide are encouraging the growth of tourism in their economies (**Ushakov et al, 2018).**

The purpose of this study is to establish the contribution of brand positioning to destination promotion. The specific objectives of this study are: 1) To examine tourism destination branding as a contemporary method in promoting tourism products. 2) To provide recommendations on how to increase KVNP's marketing activities through brand formation and promotion.

LITERATURE REVIEW

Globally, the predisposition to focus on the requirements of the consumer is important and the magnitude of applying marketing tools is growing. Firms have to gain a competitive market position through the identification and formation of brands. Given the potential of the tourism industry to contribute to all of the Sustainable Development Goals (SDGs) of the 2030 Agenda for sustainable development (Zhou, 2020), marketing now becomes a platform that combines many of the managerial scientific disciplines and management functions in activities of business enterprises (Nezamova and Olentsova 2021).

The increase in the number of people moving across different countries annually has made tourism progressively a key source of growth and development for most economies (Zhou, 2020). However, the development of tourism in Africa is being hindered by many factors which include; political instability, infrastructure underdevelopment, lack of access to tourism destinations, absence of direct flights, few suitable promotional marketing strategies, inability of governments to react to market changes or market signals and investment budgets among other factors (Zhou, 2020). All these problems are synonyms to Uganda's tourism sector. Because the image of these countries is composed of negative elements, it therefore becomes unlikely for them to attract many tourists, foreign investors, and trade partners **(Anholt,** 2007).

Despite the many aforementioned problems affecting the tourism industry in Africa, the volume and value of international tourism continue to grow tremendously. Much of the growth is attributed to tourism now migrating from an elite activity to one for the masses (Fyall et al, 2019). As Zhou, (2020) pointed out that; despite Africa being portrayed as a continent associated with poverty, war, disease, anguish, hunger, and harassment by foreign mainstream media, the number of international tourists to the region continues to grow. Nevertheless, for Africa to gain from the tourism industry, the region has to synchronize its tourism offerings to marketplace forces (Zhou, 2020) and address the forces for change with changed robustness and professionalism (Fyall et al, 2019). This therefore implies that there is a need for expertise in the field of branding to effectively position Africa's tourism resources; Uganda inclusive.

Brands have now become important routes for nations' image enhancement and have the power to accelerate and result in changes in public perception of countries **(Anholt,** 2007). Consumers are now more concerned about the origin of brands and continue to search for something with a little more integrity. Most people perceive that brands coming from countries such as America, Germany, Italy, or Japan add more credibility and appeal to products than brands coming from developing countries. With such thoughts in consumers' minds charging a premium price for a brand in such a country that does not have a loyal consumer base seems absurd. This therefore implies that the management of destinations from such countries has to reposition the image of their destinations to appeal to consumers at a global standard.

Figure 1

The AIDAR Model

A **I** **D** **A** **R**

This paper analyses the application of the AIDAR model in building brand awareness and promoting tourism destinations. The original AIDA model was developed by American businessman and advertising advocate Elias St. Elmo Lewis in 1898. It is a useful tool for analyzing marketing strategies and campaigns. It is designed to help businesses increase their sales by focusing on the customers' journey towards purchase and providing a memorable experience at each stage. The AIDA model has four elements which stand for: Awareness/Attention, Interest, Desire, and Action. This tool has been used by many companies around the world to establish strong relationships with their target audience. It has helped in building brand awareness, increasing customer engagement, driving up sales, and maximizing customer loyalty. According to Bishar and Robertine, (2023), the AIDA model is considered to be an effective tool in evaluating advertising impact and also the promotion and branding of products because it permits control over every individual psychological change stage that occurs right from the original exposure with the advertisement to the last purchase decision. It has now been modified to include the fifth element of **Retention** which makes it to become **AIDAR.**

Discussion and Application of the AIDAR Model

Awareness/Attention

The objective of the first stage is to grasp the attention of the target audience. In this stage, different sources such as advertisements, testimonials, reviews, and recommendations from friends and family are used to provide information about a product to the potential target market. To ensure that the message is unique, marketers need to create attention-getting, highly creative content that is inspiring and stands out from the competition (Bishar and Robertine, 2023). This can be achieved by using an interesting headline, creating eye-catching visuals, or developing an engaging story to capture the viewer's attention.

A study by Bagaihing and Conterius (2020) on tourist perception of the AIDA model's implementation in the media of promotion in tourism attractions, found that tourists' perception of the element of *attention* was higher about information from word-of-mouth communication and getting information from Facebook. Getting information obtained from government websites scored the least. This is because government websites are not well managed as far as promoting a destination is concerned. This finding was also in agreement with the study of Saeed and Shafique (2019) on Customer-based brand equity and destination visit behavior in the tourism industry, which found that the use of social media is seen to change tourists' perception and also rebuild the image of a destination. This therefore implies that personal recommendations and social media channels are key in attracting consumers towards a product.

Interest

The second step is to create customers' interest in the product. This can be achieved using various methods such as explaining the unique features of the product and the benefits that the product gives. Emotional connections can be created

with the consumers by using storytelling techniques about the brand to make them more interested in the brand. This also agrees with the study of Bagaihing and Conterius (2020) who found out that tourists' perception of *interest* in promotion media for tourism is significant concerning verbal communication compared to the use of images to create interest. This explains that tourists who visit a destination get to know it through word-of-mouth communication which can only be conveyed verbally without using a picture of the existing attraction. Organizations can also use web-based entertainment like Google Analytics or Facebook Analytics to generate interest (Purbaningsih et al, 2022). At this point, the consumers can visit the site and use articles about the product they wish to purchase.

Desire

At this step, the goal of the marketer is to make the target market feel the need for the product and to make them believe that it will be beneficial to them. At this point, the use of persuasive language and pointing out the unique features of the product is key in helping to create a strong desire for the product. Purbaningsih et al, (2022) noted that *desire* can be achieved by making a catchy phrase that can make a yearning interest to purchase the product. This implies that using interesting sentences in promotional media can induce consumers' desire for the product. Catchy phrases such as 'KVNP the Nature Positive destination' will arouse the desire of tourists who desire eco-tourism**.**

Action

The goal at this step is to make the target market act and make the purchase. A clear call to action can be used through phrases such as 'Visit Kidepo today', 'Act now', and 'Limited time offer'. At this level, organizations can give price discounts, and vouchers to induce consumers into action. The focus of marketers should be on how the consumer will finalize the entire cognitive process with an actual procurement which involves concrete action of buying the product. Bagaihing and Conterius (2020) found that tourists' perception of *action* in the promotion media for tourism is significant taking a visiting action compared to other factors that involved describing the destination and revisiting the destination among others. This implies that consumers in tourism will be more satisfied when they physically go to the tourist attraction than just telling a story about it virtually. As Gnanapala (2017) noted, "*Observing wildlife is one of the major travel motives of tourists and plays an important role in their destination selection process. Tourists like to view non-captured animals.*" KVNP which is majorly a wildlife destination, there is a need to tap into the market for pure tourism by influencing consumers to visit the destination.

Retention

The last step is to create opportunities for long-term mutually beneficial relationships for the customers. Destination managers need to build on the connections that exist with the people who visit the destinations, provide opportunities for feedback, and provide follow-up support, and reviews. Tourism organizations can utilize social media platforms such as Instagram, Pinterest, Twitter, Facebook, and YouTube to promote the destination services for instance the route via images, videos, and suggested itineraries, and also communicate and share visitor experiences. A study by (Saeed and Shafique 2019) noted that social media has an extensive range of consumers, more so in the Meetings, Incentives,

Conferences, and Events (MICE) industry which can be used to attract and *retain* tourists and also boost the hospitality business.

METHODOLOGY

The information required to prepare this paper came from various website resources and journal articles mainly from ResearchGate, Springer, Revistaespasios, Emerald, and Solmainternational among others, that highlighted the issue of "Brand Positioning" and "Destination promotion". The information collected was used to describe the underlying concepts and generate ideas and insights that are useful for developing destination promotion strategies. It is a descriptive paper in nature and the author's arguments are based on the literature obtained from other studies.

FINDINGS

The reviewed literature revealed that; the rapid growth of the tourism sector requires governments to put in place new promotional methods and approaches which include branding of tourism destinations **(**Ushakov et al, 2018). A study by Medel, (2020) on advertising in tourism, noted that consumer behavior in tourism is changing, and measuring the effectiveness of advertising for the tourism industry cannot just be limited to tangible results, like the number of visitors or money spent on a destination. Alternatively, intangible elements such as brand awareness, destination awareness, and recognition should be emphasized. This, therefore implies that with the increasing global travel, destinations have to reposition their brand identity, especially in the present technological revolution to attract visitors. The progressive expansion of the internet has made customers have more choice and access to more information which makes them more likely to make purchase decisions based on assurance of knowledge instead of need alone.

Tourism destination branding requires the brand to first be accepted internally, then, throughout the nation by all the stakeholders, and then promoted internationally. Many tools can be used to promote the brand ranging from websites, advertising campaigns, trade missions, and embassies abroad. Branding and Communication experts can be used to advise in the process of rolling out, managing, and promoting the brand (www.aalep.eu/why-nation-branding-important-tourism). Destination managers are required to identify the destination's strong and competitive assets that are appealing to potential visitors, create an engaging story from the assets that make the destination look unique, and then develop effective marketing communication to promote the destination.

CONCLUSION

Destination marketing and promotion are among the key activities in effectively managing a destination. It involves reaching out to the intended market, and maintaining mutual relationships with them while encouraging regional and international diffusion. For a tourism region to be sustainable, it needs to create a competitive advantage in this growing and highly competitive tourism market. The AIDAR model as a marketing strategy is seen to be very suitable for promoting tourism destinations in this era which is increasingly digitalized in all sectors and where brands have based their entire marketing strategy on this model. The AIDAR model enables managers to build passionate, engaging, and empowering brand stories that resonate among the locals and visitors as well. It helps in evaluating the competitive level

of the brand and considering its superiority and uniqueness. There is a need to maintain and enhance the existing products and where opportunities or gaps are identified, investment in new products, infrastructure, and, amenities should be undertaken to strengthen the destination's demand and competitiveness. However, managerial expertise in destination branding and communication is required to sustainably promote the destination. This study recommends practical application of the model which can also be used to promote other tourism destinations in Uganda.

THE FUTURE OF TOURISM: BUSINESS MODELS AND OPPORTUNITIES IN THE METAVERSE

Huina. Gao
Beijing International Studies University/Tourism Sciences
Beijing, China

ABSTRACT
The metaverse, a collective virtual space blending enhanced physical reality with persistent virtual environments, offers transformative opportunities for tourism. This paper explores the evolving paradigm of metaverse tourism, highlighting innovative business models focused on immersive experiences through AR and VR technologies. Key revenue streams include virtual property sales, immersive advertising, virtual goods, e-commerce integration, and event ticketing. Cost structures benefit from reduced physical infrastructure, scalable digital platforms, automation, and community-driven content, leading to significant efficiencies. These findings underscore the metaverse's potential to redefine tourism with diverse, personalized, and sustainable experiences, providing a comprehensive roadmap for stakeholders.

Key Words: Metaverse Virtual Tourism Business Models Augmented Reality (AR) Virtual Reality (VR)

INTRODUCTION

The metaverse is conceptualized as a collective virtual shared space, created by the convergence of virtually enhanced physical reality and physically persistent virtual spaces. This encompasses a blend of augmented reality (AR) and virtual reality (VR) to create a seamless and immersive digital environment that coexists with the physical world. Users can interact within this computer-generated universe, which integrates elements of their real-world experiences (Ballano & Uriarte, 2021).

The metaverse is characterized by a set of distinct attributes that underscore its innovative structure and potential impact across various sectors. One primary attribute is its persistence; the metaverse operates continuously and does not cease or pause, but instead evolves and functions in real time, independent of individual user engagement. This continuous operation ensures that the virtual environment remains active and accessible around the clock, thus enhancing user immersion and interaction within the digital landscape (Grieves & Vickers, 2017). Additionally, the metaverse facilitates interoperability, which allows for the seamless integration and migration of experiences, assets, and identities across different platforms. This capability supports a unified and consistent user experience across various virtual environments, thereby expanding the functional versatility and user engagement potential of the metaverse (Kzero, 2019).

Furthermore, the metaverse is known for its ability to support synchronicity, accommodating real-time interactions and experiences among a vast number of users simultaneously. This attribute makes the metaverse a highly dynamic and interactive platform, suitable for various applications from social interactions to professional collaborations (Lee & Hammer, 2020). Complementing these technical features, the metaverse also incorporates a robust economic layer, complete with its own currencies, assets, and marketplaces. This economic infrastructure allows users to create, buy, sell, and trade items within the virtual context, thus fostering a fully functional digital economy. This economic model not only enhances user engagement by providing tangible incentives for participation but also paves the way for new forms of economic activity within virtual settings (Nakamoto & Smith, 2022). Collectively, these attributes significantly contribute to the metaverse’s capacity as a transformative digital environment.

The importance and relevance of the metaverse to the tourism industry are profoundly significant, heralding a paradigm shift in how tourism-related experiences are conceptualized, delivered, and consumed. The metaverse offers an expansive platform for immersive tourism, where users can explore virtual replicas of real-world destinations or entirely new, fantastical environments without the physical and economic constraints typically associated with travel (Horan, 2021). This digital approach not only broadens the accessibility of tourism experiences to a wider audience but also enhances the scope of what can be offered, extending beyond traditional tourism boundaries.

Moreover, the metaverse facilitates personalized experiences through advanced customization options, allowing users to tailor their interactions and activities according to individual preferences and interests, which can significantly enhance user satisfaction and engagement (Taylor & Khan, 2022). The integration of virtual reality and other digital technologies within the metaverse enables the creation of detailed and interactive environments that can mimic the sensory experiences of real-world travel, providing a valuable tool for marketing and pre-visit planning (Jennings & Scantlebury, 2020).

Furthermore, the economic model of the metaverse introduces novel opportunities for revenue generation in the tourism sector. Virtual tourism can incorporate elements such as ticketed events, guided tours, and themed experiences, offering new income streams for tourism operators. Additionally, the metaverse's capacity for integrating digital transactions through cryptocurrencies and blockchain ensures secure, transparent, and efficient financial exchanges, which are crucial for the global nature of the tourism industry (Chen, 2021).

This research paper aims to comprehensively delineate the transformative potential of the metaverse within the tourism sector by addressing several key objectives. Firstly, it seeks to conceptualize the metaverse by defining its core technologies, such as augmented and virtual reality, and examining their role in fostering a new tourism paradigm that offers enriched and accessible experiences. Secondly, through the analysis of case studies from early adopters, the paper intends to extract practical insights that highlight both successes and areas for improvement. Moreover, the study will analyze innovative business models emerging within metaverse tourism, focusing on how these models challenge traditional boundaries through virtual experiences and immersive storytelling.

The scope of this research paper is defined by a multifaceted approach that examines the intersection of technology and tourism within the metaverse. It will primarily focus on the pivotal role of augmented reality (AR), virtual reality (VR), blockchain, and cryptocurrencies in reshaping the tourism industry. The analysis extends to the exploration of innovative business models that have emerged in metaverse tourism, emphasizing their economic and marketing dimensions. Recognizing the global influence of the metaverse, the paper will incorporate international case studies and examples to ensure broad applicability and relevance.

The originality of this research lies in its comprehensive exploration of the transformative impact of the metaverse on the tourism industry. By conceptualizing the metaverse as a convergence of virtually enhanced physical reality and physically persistent virtual spaces, the study delves into the innovative business models emerging within this new paradigm. The research uniquely identifies key revenue streams, such as virtual property sales, immersive advertising, virtual goods, e-commerce integration, and event ticketing, highlighting their novel monetization opportunities. Additionally, it examines the cost structures in metaverse tourism, emphasizing the benefits of reduced physical infrastructure needs, scalable digital platforms, automation, and community-driven content creation. These insights collectively demonstrate the metaverse's potential to redefine tourism through diverse, personalized, and sustainable virtual experiences, providing a pioneering roadmap for stakeholders in this emerging virtual frontier.

CONCEPTUALIZING THE METAVERSE IN TOURISM

The metaverse represents a burgeoning frontier in the digital transformation of the tourism industry, blending advanced technologies such as augmented reality (AR) and virtual reality (VR) to create a unique, immersive experience that transcends conventional travel limitations. This section seeks to delineate the core aspects of the metaverse as it pertains to tourism, outlining its technological infrastructure and the potential it holds to revolutionize how tourist experiences are crafted and delivered.

Firstly, the metaverse is characterized by its ability to synthesize enhanced physical realities with persistent virtual spaces, thus allowing for the creation of detailed, interactive replicas of real-world destinations, as well as entirely novel environments. These capabilities not only democratize access to global travel experiences but also enable customization and personalization to an unprecedented degree, potentially increasing engagement and satisfaction among tourists (Horan, 2021).

Moreover, the integration of AR and VR technologies plays a crucial role in enhancing the sensory aspects of virtual tourism. These technologies provide tourists with a sensory-rich, interactive experience that can closely mimic or even enhance the sensations of visiting actual destinations. The implications for marketing and pre-trip planning are profound, as potential visitors can explore destinations virtually before committing resources to physical travel (Jennings & Scantlebury, 2020).

In addition, the economic layer of the metaverse, supported by blockchain technology and cryptocurrencies, introduces a secure and efficient means of conducting transactions within these virtual spaces. This not only facilitates the purchasing of virtual tourism services but also paves the way for the creation of new economic models and revenue streams within the industry (Chen, 2021).

CASE STUDIES OF EARLY ADOPTERS

The advent of the Metaverse is revolutionizing the tourism industry, offering unprecedented opportunities for immersive and interactive experiences. This essay examines pioneering entities in the tourism sector that are leveraging Metaverse models to enhance their offerings, supported by recent literature.

One of the foremost examples of innovation in Metaverse tourism is the application of digital twins and immersive cyberspaces, as exemplified by the MetaOmniCity project. This initiative utilizes smart city digital twins to create dynamic and interactive urban environments in the Metaverse, allowing users to explore urban settings virtually. Such applications not only enhance user engagement but also provide valuable insights into urban planning and management (Kuru, 2023). The ability to simulate real-time changes and interactions within these virtual cities represents a significant advancement in urban tourism.

Another pioneering entity in the Metaverse tourism landscape is TUI Group, which has integrated Metaverse experiences into its travel offerings. By creating virtual tours and interactive travel guides, TUI Group provides customers with a taste of their destinations before they visit physically. This approach enhances customer engagement and satisfaction by allowing potential travelers to explore and plan their trips in a more informed manner (Ampountolas et al., 2024). This blend of virtual and physical tourism experiences exemplifies the hybrid model that many companies are beginning to adopt.

The use of blockchain technology in Metaverse tourism is another notable innovation. Companies such as TravelX are leveraging blockchain to create secure and transparent transactions within the Metaverse. Blockchain ensures the authenticity of digital assets and transactions, fostering trust among users. This technology is particularly useful for managing virtual property sales, ticketing for virtual events, and other e-commerce activities within the Metaverse (Puri et al., 2023). The integration of blockchain not only enhances security but also streamlines operations and reduces fraud.

Educational institutions are also exploring the potential of the Metaverse to offer virtual field trips and immersive learning experiences. Universities and museums are using VR and AR to create detailed and interactive simulations of

historical sites, scientific phenomena, and cultural artifacts. This approach not only enhances the educational value of these experiences but also makes them accessible to a broader audience, including those who may not be able to travel physically (Jia et al., 2023). The educational applications of the Metaverse demonstrate its versatility and potential for enriching tourism experiences.

Furthermore, the hospitality industry is embracing Metaverse technologies to enhance customer experiences. Hotels and resorts are creating virtual tours of their properties, allowing potential guests to explore rooms, amenities, and surroundings before making a booking. This innovation improves customer satisfaction by providing a more transparent and engaging booking process (Agnihotri et al., 2024). Virtual concierge services, powered by AI, also offer personalized recommendations and assistance to guests, enhancing their overall stay.

Cultural preservation and promotion are also significant areas where Metaverse tourism is making an impact. Initiatives such as the Virtual Heritage Project are creating detailed 3D models of cultural and historical sites, allowing users to explore these sites in a virtual environment. This not only aids in the preservation of these sites by reducing physical wear and tear but also makes them accessible to a global audience (Deretić & Kukolj, 2023). The use of immersive storytelling and interactive elements enhances the educational value of these virtual tours.

In conclusion, pioneering entities in the tourism industry are leveraging Metaverse models to create innovative and immersive experiences. From urban exploration and travel planning to secure transactions and educational applications, the Metaverse is transforming how tourism is experienced and managed. These advancements highlight the potential of Metaverse tourism to enhance accessibility, engagement, and sustainability in the tourism sector.

INNOVATIVE BUSINESS MODELS IN METAVERSE TOURISM

A business model is a conceptual structure that supports the viability of a business and explains how it operates, makes money, and how it intends to achieve its goals. Essentially, it’s a blueprint that outlines the value it offers to its customers, the mechanisms it employs to deliver that value, and the methods of generating revenue(Johnson, Christensen, and Kagermann ,2008). Here’s a breakdown of the primary components typically involved in a business model in Metaverse Tourism.

VALUE PROPOSITION

This is the core of the business model in Metaverse Tourism, which defines why tourists would choose this destination over competitors. It includes the products or services the destination offers and the unique benefits it provides.The following discussion delineates the various products and services offered in Metaverse tourism, highlighting their unique benefits across five distinct categories.

Firstly, virtual travel experiences employ VR technology to simulate travel experiences, allowing users to explore global destinations in a fully immersive environment. The primary advantage of virtual travel is its ability to make remote and costly destinations accessible to a broader audience. This is particularly beneficial during times of global travel restrictions or for individuals constrained by health or mobility issues. Virtual travel serves as a viable alternative to conventional travel, broadening the scope and reach of tourism(Florido-Benítez,2024).

Secondly, augmented reality tours enhance real-world environments by overlaying digital information directly onto them. AR tours enrich the user's perception of reality, offering interactive and enhanced experiences without the need for physical presence at the tourist sites. These enhancements may include historical data, art overlays, or interactive features that facilitate deeper engagement with the location, thereby enriching the tourist experience(Martí-Testón, et al.,2023).

Thirdly, Metaverse platforms offer interactive and educational experiences that can significantly benefit educational institutions and younger demographics. These platforms provide educational tours focused on culture, history, or science, which are often gamified to increase engagement. The educational component is seamlessly integrated with entertainment, making learning more appealing and interactive(Buhalis, et al.,2022).

Fourthly, the Metaverse fosters social interaction and community building by creating virtual social spaces where users from different geographical locations can meet, interact, and share experiences as if they were together in real life. This capability is instrumental in building a sense of community among users, offering social connectivity that transcends physical boundaries(Monaco&Sacchi,2023).

Fifthly, the personalization of travel experiences is a key feature of Metaverse tourism. By utilizing data analytics and user preferences, these platforms can offer highly personalized travel experiences tailored to individual interests and needs. This can range from adventure and exploration to relaxation and meditation, catering to a diverse user base with varying preferences(Buhalis,Leung,&Lin,2023).

In conclusion, the business models in Metaverse tourism are distinguished by their innovative use of VR and AR technologies to create immersive and interactive experiences. These models not only enhance the accessibility and personalization of travel but also promote educational value and social interaction in virtual settings.

TOURIST SEGMENTS

The burgeoning domain of Metaverse tourism caters to a diverse array of user groups, each with distinct motivations and requirements that make virtual tourism an appealing alternative to traditional travel. This session delineates the primary segments of the Metaverse tourism market, highlighting the unique benefits this innovative platform offers to each group.

The first significant user group comprises the Younger Generations, specifically Millennials and Generation Z. These cohorts are inherently adept at navigating digital landscapes and exhibit a robust appetite for technological innovations. Metaverse tourism, with its immersive and interactive experiences, is particularly well-suited to these users. The platform's ability to simulate real-world travel experiences in a virtual environment offers them a novel way to explore the world, aligning seamlessly with their tech-centric lifestyles. Siddiqui et al. (2022) explore virtual tourism and digital heritage, emphasizing the significant engagement of Millennials and Generation Z with platforms like YouTube360 and Facebook's Metaverse. These generations' familiarity and comfort with digital technologies make them ideal users of Metaverse tourism.

Another critical group includes individuals with Mobility Limitations. For many in this category, physical constraints significantly restrict the feasibility of traditional travel. Metaverse tourism emerges as a revolutionary solution by removing these barriers, allowing users to experience new cultures and destinations virtually. This mode of travel not only broadens accessibility but also enhances inclusivity within the tourism industry, enabling people with disabilities to partake in global explorations just as freely as their able-bodied counterparts.Studies have highlighted how virtual reality and Metaverse platforms remove barriers for individuals with mobility limitations, enabling them to experience travel and cultural exploration without the physical constraints associated with traditional travel(Siddiqui et al.,2022).

Global Travelers and Expatriates represent a third user group. This segment includes individuals residing far from their native or desired destinations, whether for work, education, or personal reasons. Metaverse tourism serves as a bridge, offering them the opportunity to reconnect with their homelands or explore new locales without the need for extensive travel. This virtual approach can significantly mitigate feelings of nostalgia and geographical isolation, providing a sense of closeness and connection irrespective of physical distances. Zaman et al. (2022) discuss how international

expats and global travelers, particularly those facing travel anxieties or restrictions (such as during the COVID-19 pandemic), find value in Metaverse platforms for virtual space travel and exploration, maintaining cultural and social connections.

Finally, Cultural and Historical Enthusiasts find a valuable tool in Metaverse tourism. This platform enables a deep and enriched engagement with various sites of cultural and historical significance. Through context-aware virtual tours that offer comprehensive narratives and insights, users can gain an educational experience that rivals physical visits. Such enriched interactions are especially beneficial for those interested in cultural preservation, historical research, or environmental education, providing a detailed exploration of sites that might otherwise be inaccessible.Yun (2023) notes the potential of combining cultural heritage and gaming experiences in the Metaverse, particularly appealing to Generation Z. This approach enhances the engagement of cultural and historical enthusiasts through interactive and gamified learning experiences.

In summary, Metaverse tourism presents a versatile and innovative platform that caters to a wide range of users—from tech-savvy youths to individuals with mobility challenges, as well as global nomads and cultural aficionados. Each group benefits from tailored experiences that enhance their understanding and enjoyment of global cultures and destinations, all from the comfort of a virtual setting. This adaptability not only expands the scope of who can participate in tourism but also how they engage with the world, marking a significant evolution in the travel industry.

CHANNELS

The burgeoning domain of Metaverse tourism is characterized by its innovative use of virtual platforms, which cater to a wide array of market needs while enhancing user experiences significantly. These platforms have introduced unique distribution and sales channels that leverage the distinct capabilities of virtual environments. This session delineates the primary innovations that are reshaping the landscape of Metaverse tourism, highlighting how these developments are transforming traditional business models.

One of the most notable innovations within Metaverse tourism is the concept of virtual property and asset sales. In these virtual environments, users have the opportunity to acquire properties and assets, thus generating new revenue streams for businesses operating within the Metaverse. This digital extension of real estate principles allows users to invest in and benefit from markets that replicate the dynamics of the physical world but are accessible within the virtual realm(Nalbant,2022).

Furthermore, digital marketing and co-creation strategies have been effectively adapted to the unique context of the Metaverse. Businesses within this virtual space utilize interactive and immersive digital marketing techniques that engage consumers directly. These strategies often involve collaborative efforts with consumers, fostering a co-creation environment that not only enhances user engagement but also personalizes the experience. Such approaches significantly boost customer satisfaction, loyalty, and attachment to brands within the virtual tourism sector(Nalbant,2022;Buhalis,Leung,&Lin,2023).

The integration of e-commerce functionalities represents another critical innovation in Metaverse tourism. This integration facilitates direct sales and marketing interactions within the virtual experience itself, allowing users to seamlessly purchase goods and services. The convenience and accessibility provided by these integrated e-commerce platforms streamline the consumer experience, enhancing the ease with which transactions are conducted within the Metaverse(Buhalis,Leung,&Lin,2023).

The adoption of cryptocurrencies and blockchain technology in Metaverse tourism also marks a significant development. These technologies offer a secure and efficient means for conducting transactions, ensuring the authenticity and reliability of exchanges within the Metaverse. The use of blockchain fosters a trustworthy commercial environment, crucial for the economic activities that occur in these virtual settings(Buhalis,Leung,&Lin,2023).

Lastly, the employment of augmented reality (AR) and virtual reality (VR) technologies within Metaverse tourism platforms has greatly enhanced the realism and interactivity of virtual tours and experiences. These technologies enable the creation of highly immersive experiences that closely mimic real-world interactions, thereby broadening the appeal of Metaverse tourism and expanding its market potential(Florido-Benítez,2024).

In conclusion, the innovative distribution and sales channels introduced by Metaverse tourism are revolutionizing the sector. By leveraging advanced digital technologies and integrating novel business practices, these platforms offer enhanced user engagement, expanded economic opportunities, and transformative travel experiences. As these technologies continue to evolve, they promise to further redefine the boundaries between virtual and physical tourism.

CUSTOMER RELATIONSHIPS

The innovation in customer relationships for Metaverse tourism is profoundly reshaping how businesses interact with and engage their customers. These innovations leverage advanced digital technologies to create more personalized, immersive, and interactive experiences, significantly enhancing customer satisfaction and loyalty. This essay delineates the key innovations that are transforming customer relationships within Metaverse tourism, drawing on recent literature for support.

One of the most significant innovations within Metaverse tourism is the development of personalized customer experiences. By utilizing data analytics and artificial intelligence, businesses can offer highly tailored experiences that align with individual user preferences and behaviors. Through the analysis of user data, companies can provide customized travel recommendations, personalized marketing campaigns, and enhanced customer support, thereby improving overall customer satisfaction and fostering loyalty (Buhalis et al., 2023; Sánchez-Amboage et al., 2024).

Immersive and interactive engagement is another groundbreaking innovation enabled by Augmented Reality (AR) and Virtual Reality (VR) technologies. These technologies are central to creating deeply engaging customer experiences in the Metaverse, allowing users to interact with destinations in a highly realistic manner. The immersive nature of AR and VR enhances the emotional and experiential connection with the brand, leading to higher levels of customer engagement and satisfaction (Monaco & Sacchi, 2023; Florido-Benítez, 2024).

Enhanced social interaction is also a crucial aspect of customer relationship innovations in the Metaverse. The Metaverse provides platforms for social interaction and community building, allowing customers to connect with others in virtual environments. These social interactions can enhance the sense of community and belonging among users, making the overall experience more engaging and enjoyable. Businesses can facilitate these interactions through virtual events, social hubs, and collaborative activities (Chen, 2024).

Co-creation and customer involvement are integral to the innovations in Metaverse tourism. Businesses encourage customers to actively participate in creating content and experiences within the Metaverse. This approach not only boosts customer engagement but also allows companies to gather valuable insights and feedback from users. These insights can then be used to refine and improve the offerings, creating a more dynamic and responsive service environment (Jafar & Ahmad, 2024).

Another significant innovation is the seamless integration with e-commerce functionalities within Metaverse platforms. This integration allows customers to make purchases directly within the virtual environment, enhancing the convenience and accessibility of shopping. Users can buy travel packages, merchandise, and other services without leaving the virtual space, which can drive higher sales and improve customer satisfaction by streamlining the transaction process (Sánchez-Amboage et al., 2024; Volchek & Brysch, 2023).

Security and trust are critical components in the Metaverse tourism experience, facilitated by the implementation of blockchain technology. Blockchain provides a secure and transparent method for conducting transactions, ensuring the authenticity and reliability of digital exchanges. This technology enhances customer trust and confidence in the virtual tourism services, fostering a safer and more secure environment for users (Sánchez-Amboage et al., 2024).

In conclusion, the innovations in customer relationships within Metaverse tourism are transforming the way businesses engage with their customers. Through personalized experiences, immersive engagement, enhanced social interaction, co-creation, seamless e-commerce integration, and secure transactions, Metaverse tourism is setting new standards for customer satisfaction and loyalty. These advancements underscore the significant potential of the Metaverse to revolutionize the tourism industry by offering novel, engaging, and secure experiences to a global audience.

REVENUE STREAMS

The innovation of revenue streams in Metaverse tourism introduces several unique approaches that leverage digital technologies to create new avenues for monetization. These innovations not only enhance traditional revenue models but also offer novel opportunities tailored to the virtual environment. This essay delineates the key innovations in revenue streams for Metaverse tourism, drawing on recent literature to highlight their significance.

One of the most significant innovations in Metaverse tourism is the advent of virtual property and asset sales. Metaverse platforms allow users to buy, sell, and trade virtual properties and assets, such as virtual real estate, non-fungible tokens (NFTs), and digital collectibles. This creates a new market for virtual assets, offering businesses and individuals opportunities to invest in and profit from virtual real estate markets (Wu et al., 2023). The emergence of this market underscores the economic potential of virtual environments and the scalability of digital asset trading.

Advertising and sponsorships within the Metaverse represent another crucial innovation in revenue streams. Metaverse platforms provide unique opportunities for immersive advertising and sponsorships, enabling brands to create engaging advertisements and sponsor virtual events. This form of advertising leverages the interactive nature of the Metaverse to create memorable brand experiences, leading to high engagement and visibility among users (Sever, 2023). This innovative approach allows brands to connect with consumers in novel and impactful ways.

The sale of virtual goods and merchandise is a significant revenue stream in Metaverse tourism. Users can purchase a variety of digital items, including avatars, clothing, accessories, and other virtual merchandise, to personalize their virtual experiences. This continuous revenue stream is driven by microtransactions, where users regularly buy small, digital items to enhance their virtual presence (Chen, 2024). The popularity of virtual goods underscores the importance of personalization in user engagement and retention.

E-commerce integration within the Metaverse is another key innovation. The seamless incorporation of e-commerce functionalities allows users to purchase physical products directly from virtual stores, bridging the gap between virtual and physical retail. This integration enhances convenience for users and expands the potential market for businesses, allowing them to reach customers in both virtual and physical realms (Sánchez-Amboage et al., 2024). This dual

approach to commerce represents a significant advancement in retail strategies.

Event ticketing and virtual experiences provide another sustainable revenue model for Metaverse tourism platforms. By selling tickets for virtual events such as concerts, exhibitions, and tours, these platforms offer unique, immersive experiences that attract participants willing to pay for access (Suanpang et al., 2022). The ability to host and monetize virtual events demonstrates the versatility and economic viability of the Metaverse as a platform for various types of entertainment.

Offering virtual educational programs and training sessions within the Metaverse attracts institutions and individuals seeking innovative learning experiences. These programs can be monetized through course fees and certification programs, adding another revenue stream (Go & Kang, 2023). The educational potential of the Metaverse extends beyond traditional settings, providing immersive and interactive learning environments that can significantly enhance educational outcomes.

Blockchain and cryptocurrency transactions are critical innovations supporting various revenue streams in Metaverse tourism. The use of blockchain technology and cryptocurrencies ensures secure, transparent, and efficient payment processes. This technology supports virtual property transactions, microtransactions, and subscriptions, providing a reliable payment infrastructure (Florido-Benítez, 2024). The integration of blockchain enhances trust and security in financial transactions, which is vital for the sustained growth of virtual economies.

In conclusion, the innovations in revenue streams for Metaverse tourism are transforming the economic landscape of virtual environments. Through virtual property sales, immersive advertising, virtual goods, e-commerce integration, event ticketing, educational programs, and blockchain transactions, Metaverse tourism platforms are pioneering new business models. These advancements underscore the significant potential of the Metaverse to revolutionize the tourism industry by offering diverse and sustainable revenue opportunities.

COST STRUCTURES

The innovation of cost structures in Metaverse tourism leverages advanced digital technologies to optimize expenses and enhance operational efficiency. These innovations are fundamentally reshaping the financial landscape of virtual tourism, enabling businesses to offer immersive experiences while managing costs effectively.

One of the primary innovations in the cost structure of Metaverse tourism is the reduction of physical infrastructure expenses. Traditional tourism requires significant investment in physical assets such as hotels, transportation, and maintenance of tourist sites. In contrast, Metaverse tourism relies on digital environments, which drastically reduce the need for physical infrastructure. By utilizing virtual reality (VR) and augmented reality (AR) technologies, businesses can create and maintain virtual destinations at a fraction of the cost required for physical infrastructure (Wu et al., 2023).

Another significant innovation is the scalability and flexibility of digital platforms. Virtual environments can be easily scaled to accommodate a large number of users without the constraints of physical space. This scalability allows for a more efficient allocation of resources, as businesses can adjust their offerings based on demand without incurring substantial additional costs. The flexibility of digital platforms also enables businesses to quickly adapt to changes in user preferences and market trends, further optimizing cost management (Buhalis et al., 2023).

Moreover, Metaverse tourism benefits from lower labor costs. The automation of many operational processes through

AI and machine learning reduces the need for a large workforce. For instance, virtual tour guides and customer service agents can be replaced with AI-driven avatars and chatbots, providing 24/7 support at a lower cost. This automation not only reduces labor expenses but also enhances the consistency and quality of customer interactions (Chen, 2024).

The use of blockchain technology in transactions within the Metaverse introduces cost efficiencies related to financial operations. Blockchain provides a secure and transparent method for handling transactions, reducing the need for intermediaries such as banks and payment processors. This reduction in intermediaries decreases transaction fees and speeds up the payment process, contributing to overall cost savings. Additionally, the transparency of blockchain enhances trust and reduces the risks associated with financial fraud (Florido-Benítez, 2024).

Marketing and promotional costs are also optimized in Metaverse tourism through the use of digital marketing strategies. Traditional marketing methods, such as print media and physical advertisements, can be expensive and less targeted. In contrast, digital marketing within the Metaverse allows for highly targeted and interactive advertising campaigns. Businesses can leverage user data to create personalized marketing messages, improving the effectiveness of promotional activities while reducing overall marketing expenditures (Sánchez-Amboage et al., 2024).

Finally, the collaborative and co-creative nature of the Metaverse fosters community-driven content creation, which can significantly reduce content development costs. Users can contribute to the creation and enhancement of virtual environments, driven by their interests and creativity. This user-generated content not only enriches the virtual experience but also reduces the burden on businesses to continually produce new content, leading to cost savings in content development (Suanpang et al., 2022).

In conclusion, the innovations in the cost structure for Metaverse tourism are transforming how businesses manage expenses while providing high-quality virtual experiences. By reducing physical infrastructure needs, leveraging scalable digital platforms, automating processes, utilizing blockchain for transactions, optimizing marketing costs, and encouraging user-generated content, Metaverse tourism achieves significant cost efficiencies. These advancements underscore the potential of the Metaverse to revolutionize the tourism industry by offering cost-effective and sustainable business models.

CONCLUSION

The metaverse, defined as a collective virtual shared space created by merging augmented reality (AR) and virtual reality (VR) with persistent virtual environments, presents transformative opportunities for the tourism industry. This research highlights the metaverse's unique attributes, such as persistence, interoperability, and real-time interaction, which collectively enhance user immersion and engagement. The metaverse's robust economic infrastructure, supported by blockchain technology and cryptocurrencies, enables secure and efficient transactions, fostering new forms of economic activity and revenue generation within virtual settings. These technological advancements significantly contribute to the metaverse's capacity as a dynamic digital environment, poised to revolutionize various sectors, including tourism.

Case studies of early adopters, such as the MetaOmniCity project and TUI Group, illustrate the practical applications of metaverse technologies in tourism. These entities leverage digital twins, immersive cyberspaces, and blockchain to create secure, interactive, and engaging virtual experiences. Educational institutions and the hospitality industry are also exploring the potential of the metaverse to offer virtual field trips, detailed simulations, and virtual tours, thereby enhancing educational value and customer satisfaction. These examples underscore the versatility of metaverse tourism in providing accessible, engaging, and sustainable experiences, highlighting its potential to transform traditional tourism models.

Innovative business models in metaverse tourism emphasize value propositions centered on immersive and interactive experiences facilitated by AR and VR technologies. The research identifies key revenue streams, including virtual property sales, immersive advertising, virtual goods, e-commerce integration, and event ticketing, all of which offer novel monetization opportunities. Additionally, the cost structures in metaverse tourism benefit from reduced physical infrastructure needs, scalable digital platforms, automation, and community-driven content creation, leading to significant cost efficiencies. These findings demonstrate the metaverse's potential to redefine the tourism industry by providing diverse, personalized, and sustainable virtual experiences, ultimately offering a comprehensive roadmap for stakeholders navigating this emerging virtual frontier.

ABSTRACT

Inclusive management is an instrument for achieving the sustainable development goals. Tourism, under certain conditions, can lead to social inclusion. Technological solutions, in particular in the area of platforms, that constitute systems for electronically agreeing exchange terms, play a role in ensuring access to difficult-to-transfer natural medicinal raw materials for groups with special health needs. Electronic platforms support knowledge management in health care. This proposal introduces an innovative project, which aim is to create an original and exemplary (model) platform for spa tourism. It will better meet the needs of exchange parties by supporting the policy of spa communes and spa protection areas, partnership with operators of tourist attractions, catering and accommodation facilities, as well as health education. The expected results include the creation and permanent maintenance of an original and exemplary (model) platform for spa tourism, the composition of functionalities and other technological characteristics of which will better meet the needs of the exchange parties than existing platforms. The long-term effect will be to support the development of the spa sector and improve the health of society. The project is based on the theory of platforms and inclusive management based on techniques for building engagement within a network of actors. The case focuses on spa development and analyses the extent to which traditional medical spas can be adapted to attract and accommodate commercial (non-state-funded) guests and international tourists.
The subject of the research is a comparative analysis of existing multi-sided platforms for accommodation, wellness, spa and health resort packages or services, and on this basis, the creation of a project of a more perfect multi-sided platform for spa packages or services. The aim of the research is to create an original and model promotion and sales platform for spa packages or services. The method of the research is a comparative analysis of functionality, user experience, customer journey path (so-called touchpoints, moments of truth and pain points) and value propositions of existing domestic and foreign multi-sided platforms (including sales platforms), as well as mobile applications of accommodation packages or services, spa and wellness, medical and spa tourism, which will be summarized by a map of user needs. The platform is an electronic intermediation institution on the e-commerce market, used for the process of agreeing the terms of exchange between the parties. We can distinguish many types of platforms, including promotional and distribution ones, which allow the supply side to communicate and sell value propositions to the demand side. One of the main goals of this type of platforms in tourism is to enable an imaginary journey in the virtual world, which is a representation of the journey in the real world. The mentioned imaginary journey is intended to encourage users to purchase a stay in order to physically explore a given destination. In case of spa destinations this should lead to improve ones health thanks to visiting of the particular place.

Key Words: platform, inclusive management, engagement, tourism, spa resorts.

INTRODUCTION

Treatment facilities and balneological spas, especially in Central and Eastern Europe, are shifting from state-subsidized health tourism to the development of wellness experiences for paying guests (Dryglas, Smith, 2023). Managers of

traditional health or medical resorts are looking for ways in which they can be adapted to attract and welcome commercial guests (not financed by the state), including international tourists, in particular through the provision of wellness services (Smith, Dryglas, 2020). In this situation, an interesting alternative for spa resort destinations is the development of marketing technology.

The subject of the research is a comparative analysis of existing multi-sided platforms for accommodation, wellness, spa and health resort packages or services, and on this basis, the creation of a project of a more perfect multi-sided platform for spa packages or services. The aim of the research is to create an original and model promotion and sales platform for spa packages or services. The method of the research is a comparative analysis of functionality, user experience, customer journey path (so-called touchpoints, moments of truth and pain points) and value propositions of existing domestic and international multi-sided platforms (including sales platforms), as well as mobile applications of accommodation packages or services, spa and wellness, medical and spa tourism, which will be summarized by a map of user needs. Research Questions:

1. What value proposition of spa resorts platforms will better meet the needs of exchange parties in therapeutic tourism?
2. What functionalities of spa resorts platforms will better meet the needs of exchange parties in therapeutic tourism?
3. Which user experience of spa resorts platforms will better meet the needs of exchange parties in therapeutic tourism?
4. Which customer journey of spa resorts platforms will better meet the needs of exchange parties in therapeutic tourism?

Due to space limitations of this article, only part of the research results will be presented, including answers to research questions 1 and 2. The rest of the article consists of the following parts: literature review (an outline of the theory of platforms and the concept of health destination platform and its relevance to sustainable development), .

LITERATURE REVIEW: AN OUTLINE OF THE THEORY OF PLATFORMS

The platform is an electronic intermediation institution on the e-commerce market, used for the process of agreeing the terms of exchange between the parties. We can distinguish many types of marketing platforms, including promotional and distribution ones, which allow the supply side to communicate and sell value propositions to the demand side. One of the main goals of this type of platforms in tourism is to enable an imaginary journey in the virtual world, which is a representation of the journey in the real world. The mentioned imaginary journey is intended to encourage users to purchase a stay in order to physically explore a given destination. In case of spa destinations this should lead to improve ones health thanks to visiting of the particular place.

To ensure the achievement of the research goal based on the most modern technologies possible, it is necessary to use a system solution, or more precisely, a dedicated, structured environment of technological solutions, i.e. an ecosystem, as a system with a complex set of environmental factors creating a network of relationships (Tansley, 1935, as cited in: Stańczyk, p. . 64), oriented towards cooperation and co-creation of value, including innovation (Klimas, 2019, pp. 38-39) with many involved entities. Due to the benefits offered, such an ecosystem should take the form of a multi-sided platform, understood as an open and participatory digital environment providing virtual intermediation, establishing contact, connecting, matching, enabling interaction and facilitating the exchange of information and educational resources regarding the project between various groups of networked users creating value. (Doligalski, 2014, p. 59; McAfee, Brynjolfsson, 2017; Parker et al., 2016, as cited in: Śledziowska, Włoch, 2020, pp. 98-101; Pawlicz, 2019, p. 88; Śledziewska & Włoch, 2021, pp. 45-47). The multilateral platform dedicated to the project will therefore constitute a digital mechanism for exchanging health, tourist, sightseeing, recreational and sports information, enabling the sharing of content in this area and capable of taking, transforming, improving and redistributing value units created by users (Szpringer, pp. 14-15).

As specified above, the designed platform is multi-sided, in particular there are two basic user groups representing the demand and supply sides, connected by the platform owner, as illustrated in the table. 1.

Table. 1. Identification of the project platform sides

<table>
<tr><th colspan="3">Platform sides features</th></tr>
<tr><th>Demand side users – consumers of the purchasing side, end users</th><th colspan="2">Functions of platform entities</th><th>Users of the supply side – consumers of the sales side, producers, complementary entities</th></tr>
<tr><td rowspan="5">health tourists</td><td colspan="2">owners</td><td rowspan="5">tourism entrepreneurs, other stakeholders in tourism development (local authorities, non-governmental organizations)</td></tr>
<tr><td colspan="2">administrators</td></tr>
<tr><td rowspan="2">content moderators</td><td>regional</td></tr>
<tr><td>local</td></tr>
<tr><td colspan="2">platform developers</td></tr>
</table>

Source: own study based on Yang et al., 2020, p. 958.

The project platform will be constructed similarly to cooperation (sharing) platforms. The basic function of the platform dedicated to the project is education and exchange of information in the field of health tourism to promote spa resort destinations.

The purpose of designing the platform is to present four models of e-marketplaces arranged according to the degree of complexity of the services and functionalities offered, the scope of integration of the demand and supply sides, and entry barriers, the scope of which increases from the broker model, through the classification, transaction and comprehensive models (Dechant, 2016). The basic elements of e-marketplaces are functionalities related to cataloging (listing), transactions and servicing the supply and demand side by the operator. Functionalities related to individual elements of the e-marketplace model are presented in Table 2.

Table 2. Functionalities of the elements of the e-marketplace model

Element	Cataloging	Transactions	Servicing the supply side	Servicing the demand side
Functionalities	• ratings and reviews, • matching algorithm, • verified accounts, • search and filtering.	• payment system, • deposit, • in-app messages.	• CRM, marketing and analytical functions, • supplies management, • financing (lending), • insurance, • service.	• recommendation engine, • customer service, • insurance, • information about arrival time.

LITERATURE REVIEW: THE CONCEPT OF HEALTH DESTINATION PLATFORM AND ITS OF RELEVANCE TO SUSTAINABLE DEVELOPMENT

This proposal is directly related to the issues of social inclusion, economic development, health and safety and partnerships, and one of its effects is the democratization of access to health tourism experiences. The project aims to address systemic issues that contribute to a lack of inclusion in tourism and proposes the use of technology to address these challenges. The identified problem is inadequacy of the current promotion of spa resorts, despite their potential. The solution to that problem is a multi-sided platform for spa resorts operating according to the AIDA model showed on Figure 1.

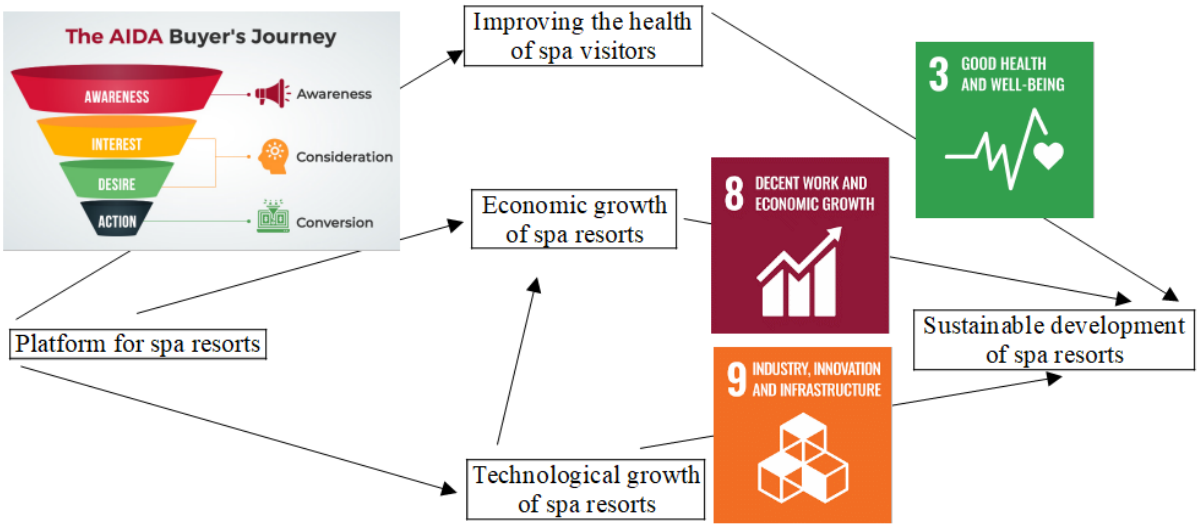

Figure 1. Model of multi-sided platform influence on spa resorts sustainable development
Source: own study.

The project assumes combining the functionalities of existing websites and applications of multi-sided platforms for health destinations. Using optimal mix of that functionalities will let to:

- improve the health of spa visitors, which will contribute to achieving sustainable development goal (SDG) no 3;

- lead to economic growth of spa resorts, which will contribute to achieving SDG no 8;
- ensure technological growth of spa resorts, which will contribute to achieving SDG no 9.

The role of the multi-sided platform for spa resorts, according to the AIDA marketing model (Hassan et al., 2015, p. 268), is to encourage people to take advantage of spa treatments. The AIDA model assumes that the advertising message affects the recipient-consumer in subsequent phases, including stages (Strong, 1925, p. 349, as cited in: Kozłowska, Pańkowski, 2018, p. 60): attracting Attention, maintaining Interest, creating Desire and geting Action.
The use of the AIDA model in designing a multi-sided platform for spa resorts is presented in Table. 3.

Table. 3. Application of the AIDA model to a multi-sided spa resorts platform

Faza modelu AIDA	Functionality of projected platform
Awareness	It presents all spa resorts in one place
Interest	It will enable an imaginary journey and a virtual experience of spa resorts
Awareness & interest	Its aim is to encourage the exchange of information regarding spa resorts and their visits.
	The user's interaction with the place is intended to expand his options for choosing a place for treatment.
	It will serve the sustainable development of spa resorts, including cooperation and health education.
Desire & action	Its purpose is to provide information and encourage people to use spa treatment.
	Engaging platform users is supposed to lead to their visit to the spa.

Source: own study based on Hassan i in., 2015, p. 268.

The designed multi-sided spa resorts platform should be constructed in such a way as to enable the achievement of the goals set in the AIDA model (Kozłowska, Pańkowski, 2018, p. 67). The platform should be attractive enough to encourage the Internet user to make further micro-conversions, i.e. complete subsequent phases in the AIDA model and move it deeper into the sales funnel (Walasik, Mizerska, 2023, p. 92). The ultimate goal of the platform will be to purchase treatments at a spa resort, hence it may contain links to offers from specific spa service providers. Online activities within the platform should be aimed at reaching every potential consumer of spa services, regardless of the stage in which he or she is in the decision-making process to purchase a spa package.

Research shows the existence of a relationship between the development of digital media and the marketing of medical tourism destinations (Alghizzawi et al., 2019). The use of attractive content in e-marketing of health destinations allows you to attract the attention of tourists (Fayed et al., 2017). The implementation of virtual reality in the healthcare, entertainment, tourism and education sectors provides engaging user experiences and improves user engagement on platforms using immersive technologies to acquire new consumers (Abdelmaged, 2021). The most advanced use of technologies from the virtual reality spectrum in the healthcare field is anti-aging digital healthcare (Mozumder et al., 2023). This shows the potential of using technology for spa resort destinations.

Due to the ongoing technological development and related processes, the role of multi-sided platforms will probably have key impact on the further progress of tourist destinations in the area of electronic services. The provision of e-services is regulated in Poland by the Act on the provision of electronic services from July 18 (Journal of Laws of 2002, No. 144, Item 1204, as amended), according to which a service provided electronically is the provision of a service provided without the simultaneous presence of the parties (remotely), by transmitting data at the individual request of the service recipient, sent and received using electronic processing devices (Kolasińska, 2020). Therefore, the platform is an institution of electronic intermediation on the e-commerce market, serving the process of negotiating terms of exchange between parties.

Multi-sided virtual platforms, which constitute a tool for virtual tourism, play an important educational role, providing knowledge about the natural, medicinal and cultural values of spa areas. By using gamification, interactive tours and educational thematic paths, recipients can gain knowledge in an accessible and engaging way. This, in turn, may contribute to increasing awareness concerning the importance of a healthy lifestyle, preventative health measures and the responsibility of health spas to help maintain good health. For this reason, filling the multi-sided spa platform with attractive content will allow the implementation of important sustainable development goals.

METHODS

Striving to answer the research questions posed in the article the following methodology of empirical research was used – case study as a method that (Yin 2015, pp. 48-49):

- explores a contemporary phenomenon in the context of reality, especially when the boundaries between the phenomenon and the context are not completely obvious;

- concerns a technically recognisable situation in which there are many more variables than data points and therefore, draws evidence from many sources and confirms the convergence of data using the triangulation method, referring to previously formulated theoretical assumptions during data collection and analysis.

A cases, i.e. an objects studied at a given time in order to describe and explain the mechanism of its functioning (Cf. Sagan 2016, p. 129), were existing multi-sided spa resorts platforms. Their study meets the criteria for the definition of the case study method, because:

- it is in-depth, long-term, iterative and carried out in the platforms natural environment, i.e. Internet;
- platforms are a modern phenomenon characterised by a relatively short life-cycle and the boundaries between the them and the context of its operation are blurred;
- a theoretical conceptual models of spa resorts multi-sided platforms (Table 1-3, Figure 1) were used, which are an inventory of their functions (a set of relations defining various effects and consequences of a given phenomenon) (cf. Nowak 2011, p. 407), which resulted in the predominance of the number of dependent variables over the considered available data.

The aim of the empirical research was to characterise the functionalities of spa resorts multi-sided platforms for their users.

The research method used in the study consisted of the stages presented in Table 4.

Table 4. The procedure of own empirical research methods as a single case study covering many units of analysis

No.	Procedure step	Stage details
1.	Theoretical justification based on literature review	35 books and peer-reviewed articles on multi-sided platforms and their functionalities
2.	Selection of the cases	Case study of Poland with 22 units of analysis of tourism sales platforms (21 commercial distribution and 1 state distribution platform)
3.	Development of tools for collecting data and information	Matrix containing the criteria for comparative assessment of multi-sided tourism platforms
4.	Conducting own research	Collecting data and information from platform websites and applications
5.	Comparative analysis of platforms	Comparing the information on platform functionalities
6.	Shaping generalisations	Classification of reasons for platforms attractiveness
7.	Confrontation with literature	Comparing platform functionalities with
8.	Closing the study – generalisation	Systematisation of reasons for platforms attractiveness

Source: own elaboration based on Glinka, Czakon, 2021, p. 58.

In Table 4, the general scheme is presented of the research procedure, part of which is empirical research based on the method of a multi case study. The analysis of several dozen items of scientific literature (point 1 of the research procedure in Table 4) on the subject, enriched with Internet sources, consisted in highlighting multi-sided platforms and their functionalities. The decision to choose a single case study was due to the exploratory nature of research on a relatively unknown phenomenon, at the initial stage of recognition (Ellram 1996, as cited in: Glinka, Czakon 2021, p. 56).

The selection of the case for the study was intentional and based on the significant position of Poland as a leading representative of supply of traditional therapeutic spa resort tourism in the world. Traditional definition of spa medicine and spa services applicable in Poland is used only in post-transformation countries, some states of Germany, Switzerland and Austria as well as partly in France (Dryglas 2020, 69-70). Spa resorts understood in the medical sense are mainly found in German-speaking countries, some parts of France, the Baltic States (Estonia, Latvia, Lithuania), Central and Eastern Europe, and Russia.

In turn, the selection of tourism multi-sided platforms as multiple units of analysis, comprising part of a single case study, was carried out considering the subject and aim of the work. The comparative analysis of existing tourism multi-sided platforms was aimed to create an original and model promotion and sales platform for spa packages or services.

The development of data and information collection tools (item 3 of the research procedure in Table 4) was based on the analysis of the scope of data and information available on the above-mentioned platforms. The specific types of platforms covered by the study are presented in the table. 5.

Table. 5. Typology of tourism multi-sided platforms covered by the study

Type of platform	General	State distribution	Commercial distribution			
	Detailed	spa resort tourism	accommodation	spa and wellness tourism	medical tourism	spa resort tourism
Platforms identified for research		Kuracjusz (software)	Booking.com	Bk4Time (software)	Bookimed	RomanThermalSpas of Europe
				BookyWay (software/application)	Whatclinic	e-Kurort
			Expedia	Mangomint (software)		
				Hoteltime (software)	Realself	sanatoria .org
				SpaDreams	Vaidam	uzdrowiska-pgu.pl
			Airbnb	SpaBooking (intermediary of Booking.com)		
				WellnessFinder	Qunomedical	uzdrowiska-pgu.pl
				ispa.pl		

Source: own elaboration.

The analysis covered the functionalities of multi-sided tourism platforms for accommodation and health services or packages (spa and wellness, medical and spa resort tourism). In order to create a model of functionality of spa resorts multi-sided platform, it was useful to analyse and comparatively evaluate basic criteria indicated in Table 6.

Table 6. Criteria for comparative assessment of multi-sided tourism platforms functionality

Assessment criterion	Characteristics
Map functionality	The map is the proper interface to start and continue virtual trips, both within one spa and to explore the network. A potential promotional virtual walk would be based on it, giving the opportunity to take a closer look at spa facilities and the accompanying infrastructure in their surroundings (including specific spots and routes with their description).
Possibility of direct online booking	Thanks to this, the booking process would be more accessible, regardless of the target customer segment. Online booking may be a key factor in finalizing a transaction between a service provider (see: health care facility) and the service recipient (patient/client).
Reservations subsidized by state insurers	Such functionality would increase access to spa treatments for people who cannot afford treatment financed from their own funds.
Selection of spa profile	Physicians issuing referrals for spa treatments financed by state insurers adjust the treatment profile to the patient's condition. People looking for health resorts privately (for a fee) often do not have unambiguous information about the therapeutic profile of the health spas provided on their websites. Therefore, the platform may include a search engine for health resorts according to treatment profiles, prompting and facilitating the choice for a potential patient.
Selection based on condition	Each facility providing spa services has its own unique therapeutic profile and a list of treatment methods for specific diseases, but private (paid) patients may not have access to such knowledge due to information asymmetry. Thus, the search engine built into the platform should provide such possibilities.

Source: own elaboration.

Comparative assessment of selected platforms using the set of criteria presented in table. 6 led to determining the effectiveness of individual platforms in implementing the AIDA model (Attention, Interest, Desire, Action), i.e. in influencing the customer to make a purchase by attracting his attention, evoking interest, desire and ultimately encouraging him to take purchasing action (Cf. Hassan et al., 2015, p. 268).

RESULTS OF EMPIRICAL RESEARCH

The results of our own research are presented in Table 7.

Table 7. Category of assessment criterion: Functionality

Type of platform	Type of platform	Map functionality	Possibility of direct online booking	Reservations subsidized by state insurers	Selection of spa profile	Selection based on condition	Points
accommodation	Booking.com	yes	yes	no	no	no	2
	Expedia	yes	yes	no	no	no	2
	Airbnb	yes	yes	no	no	no	2
spa and wellness tourism	Bk4Time (software)	no	no	no	no	no	0
	BookyWay (software/application)	no	no – due to the purpose of the website	no	no	no	0
	Mangomint (software)	no	no	no	no	no	0
	Hoteltime (software)	no	yes – but services related to the platform, not medical treatment	no	no	no	1
	SpaDreams	no	yes	no	no	yes/no	1,5
	SpaBooking (intermediary of Booking.com)	no – only after going to Booking.com		no	no	no	0
	WellnessFinder	no	yes – by asking in the form	no	yes	no	2
	ispa.pl	no	no	no	no	no	0
medical tourism	Bookimed	no	no – sending a form regarding a given medical problem	no	no	yes	1
	Whatclinic	no	no	no	no	yes	1
	Realself	no	no – only medical advice by completing the form process	no	no	no	0
	Vaidam	no	no – previous information in the form, conversation, interview, etc.	no	no (only due to the specificity of the site selection of the country of treatment)	yes	1
	Qunomedical	no	no – intermediary type website	no	no	yes	1
spa resort tourism	RomanThermalSpas of Europe	yes		no	no – only division of hotel, SPA or package	no	1
	e-Kurort	yes/no	no – shows incorrect data when booking	yes	yes	no	2,5
	sanatoria.org	no	yes – by completing the form	no, but there is a referral viewer	yes	yes	3
	uzdrowiska-pgu.pl	no	yes – by inquiry	no, but the website can be a great reference for booking through the National Health Fund	yes	yes	3
	sanatorium.pl	no	relating to parts of objects	no	yes	no	1,5
	Kuracjusz (software)	no	no – A2B software	no	no	no	0
Points		4,5	8,5	1	5	6,5	25,5

Source: own elaboration.

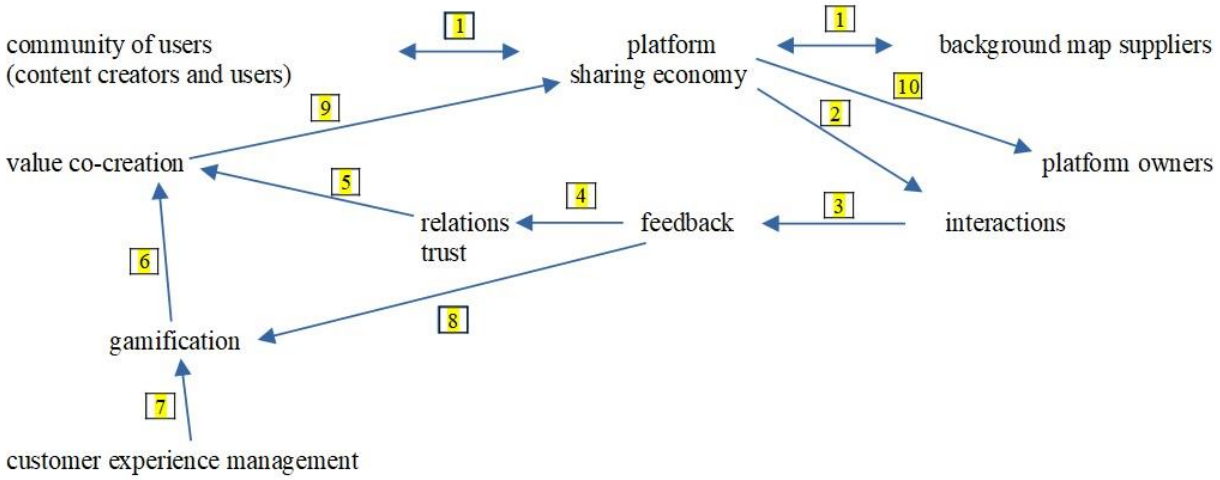
The study showed that the majority of 33% of the analyzed platforms are of a sales nature (especially accommodation and spa resorts tourism), the rest are promotional platforms without the possibility of direct booking. 25% of platforms (especially medical tourism) allow the selection of a health tourism package based on the characteristics of the patient's diseases. 20% of platforms (especially spa resorts tourism) allow the possibility of choosing a spa profile, and 18% (especially accommodation) offer search functionality using a map. Only one platform (4% of the total) allows bookings subsidized by state insurers. Some of the spa resorts tourism platforms had the widest range of selected functionalities.

The analysis provided grounds for designing a model (exemplary) platform for multilateral spa tourism. It turned out that full implementation of the functionalities selected in the study within the designed platform can become a factor of distinction and competitiveness, thanks to drawing patterns from platforms specializing in particular functionalities. Benchmarking of direct booking functionality and map functionality should be carried out in relation to accommodation platforms, selection based on the disease profile – in relation to medical tourism platforms, selection based on the spa profile – in relation to spa tourism platforms, and finally, booking subsidized by state insurers – in relation to the e-Kurort platform. When constructing the optimal combination of functionalities of the designed platform that will enable the achievement of the goal, it is necessary to draw know-how from the best in particular aspects. Therefore, the current study allowed for the acquisition of know-who knowledge.

DISCUSSION

Referring to the classification of platforms by Dechant (2016), it can be noted that the analyzed platforms represented mainly cataloging and transaction functionalities, specific to broker and classified models, however, mature accommodation service platforms such as Airbnb, Booking and Expedia are full stack marketplace models, with fully developed functionalities servicing the supply and demand side.

When designing a platform that is attractive to users, it is worth taking into account the functionalities that are considered decisive for the success of the platforms and the mobile applications that constitute their interface. These are primarily social and gamification functionalities, in accordance with the model presented in Figure 2.



Source: Stelmach et al., 2023, p. 61.

The sharing economy is a business model involving the creation of online platforms intermediating between suppliers of goods and services and their users (Mardosz-Grabowska 2020a) (arrows 1 in Figure 2). Online platforms are services enabling mutual interaction and exchange of value between users (arrows 2, 3, 4 and 5), with the platform intended to constitute an infrastructure that will allow users to interact in the most seamless way possible (arrow 2). Interactions made possible thanks to the personalization and social functions of the platform lead to the co-creation of value thanks to feedback (an example of which is feedback conducive to improving knowledge) (Ramaswamy, Ozcan, 2014, as cited in: Mardosz-Grabowska 2020b) (arrow 3, 4 and 5).

An extremely important element of the platform architecture is enabling users to provide feedback in the form of an evaluation system and access to content and defining general rules for access to the platform (arrow 3). Feedback thus becomes the basis for building trust and relationships between users (arrow 4). Mechanisms that build and institutionalize trust between the parties to the exchange of value are crucial for maintaining network effects (Śledziewska, Włoch, 2021). This trust is built and maintained mainly through a system of recommendations made by the parties to each other, but sometimes the supervision is exercised by the platform in a more direct way (based on the

platform's regulations). The platform architecture also includes defining the basic interaction between users, i.e. the main reason why they want to establish a relationship with each other (arrows 3 and 4). Gamification serves to motivate the user community to be active and co-create (Burke 2014, as cited in: Kalińska-Kula 2020) (arrow 6). Managing customer experiences in the light of flow theory influences gamification (including striving to put them in a state of flow, i.e. optimal experience, focused motivation, during which the user feels joy, creativity and commitment that go beyond the average experience (Csikszentmichalyi 2008) (arrow 7). Individualized customer experience is an important element and the basic source of value creation, hence customer experience management has an impact on value co-creation (Prahalad, Ramaswamy, 2004) (arrow 6 and 7). As part of the use of gamification mechanisms, feedback (information) provided to users plays a special role, which are a factor motivating users to share content.

The sharing economy is a business model in which, thanks to the platform's functions, value is created in the form of its co-creation by users (arrow 9) and then captured by the platform owners (arrow 10) (Amit, Zott, 2001; Zott et al. 2011 ; Demil et al., 2015; Osterwalder, Pigneur, 2010 [cited in:] Cristofaro 2020, pp. 88-89).

Drawing conclusions from previous research, the following model of the value proposition of a spa resort tourism platform can be proposed, presented in Figure 3.

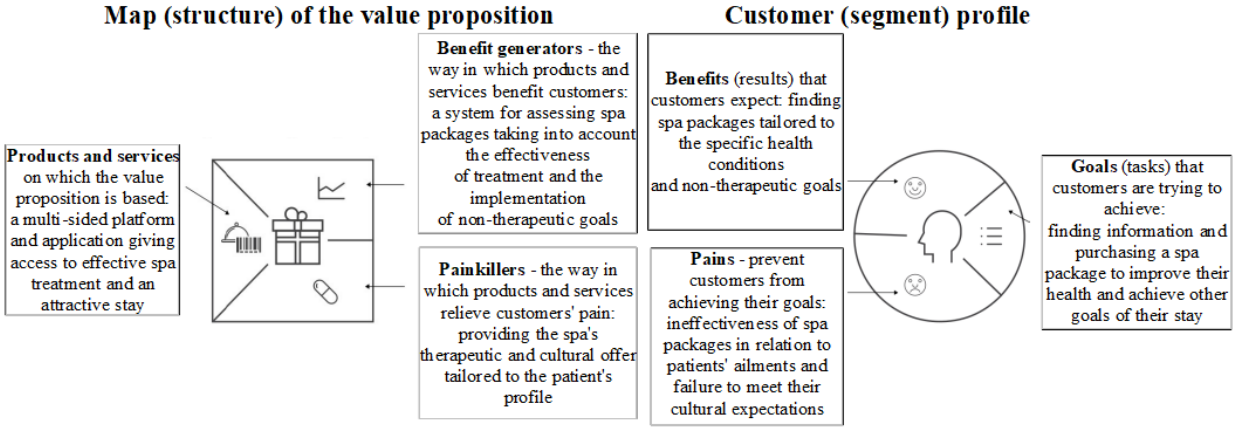


Figure 3. Model of the value proposition of a spa resort tourism multi-sided platform
Source: Own study based on: Osterwalder et al., 2015, pp. 8 and 9.

Analysing the attractiveness factors of the spa resort tourism platform distinguished on the basis of value proposition model by Osterwalder and his team (related to the combination of functionalities presented in Table 7 and Figure 2), the importance of social functionalities (the ability to recommend spa resort treatments in the platform and share them with other users) as a manifestation of Web 2.0 technology, is emphasized, the essence of which is the co-creation of content by users (UGC, user generated content), and the economy of cooperation based on sharing resources (in this case, content) by users. Projected spa resort platform should connect the community of users (including content creators) with providers of digital maps and virtual walks, developed using gamification mechanisms, where a special role is played by an extensive system of spa resort descriptions and a no less complex system of their ratings, which is a factor motivating users to share content.

CONCLUSIONS

A multi-sided platform is an institution of electronic intermediation on the e-commerce market, used for the process of agreeing the terms of exchange between the parties. The studied tourism platforms should be classified as value delivery platforms that allow the supply side to communicate information about the value proposition to the demand side or a third party and (in some cases) ultimately to acquire the value proposition. Based on the results of existing tourism muliti-sided platform functionalities research presented in that article, an important step has been taken to design and program the platform.

The proposed solution to the problem of the spa resorts current promotion inadequacy, despite their potential is the creation of an original and exemplary (model) spa resort tourism multi-sided platform, which will better meet the needs of exchange parties by supporting the policy of spa communes, partnership with operators of tourist attractions and catering accommodation facilities, as well as health education. The expected results of that project include the creation and permanent maintenance of the platform with optimal composition of functionalities and other technological characteristics. The long-term effect will be to support the development of the spa sector and improve the health of society and thus achieving the sustainable development goals.

Creating an original and exemplary (model) platform for virtual walks in spa tourism, which will better meet the needs of exchange parties, should take into account gamification and social functionalities. Their use allows for the creation

of interactions between the parties to the exchange, builds their commitment and mutual trust, provides added value, allows for its co-creation and generates the synergy effect. Therefore, efforts should be made to enrich virtual walk platforms with gamification and social functionalities that accelerate the circulation of information constituting the space of information system flows. Providing information about the possibilities of using natural medicinal raw materials allows to reduce the asymmetry of knowledge about how to improve health. Thus, inclusive management of spa resort destinations contributes to the sustainable development of spa resorts.

ABSTRACT

This study investigates the influence of pet owners' motivations for travel, attachment to pets, and value perception on their behavioral intentions and policy support for pet travel. This study verifies whether the pet attachment scale developed in Western cultures is also suitable for South Korea. By employing a multi-method approach, including factorial and cluster analyses, we aim to understand how different motivations for traveling with pets affect consumer behavior and policy attitudes. This research contributes to understanding the pet travel market, highlighting the need for tailored approaches in policy-making and industry practices to accommodate the diverse needs of pet travelers.

Key Words: Traveling with pets; Pet attachment; Value Perception; Behavior intention; Support intention

INTRODUCTION

Pets offer significant mental health benefits and enhance the quality of life for families, with a substantial portion of households globally owning pets: 66% in the United States, 46% in Europe, and 25.7% in Korea (American Pet Products Association, 2023; KB Financial Group, 2023). As pets are increasingly seen as family members, pet owners develop deep emotional and financial attachments to them (Hidalgo et al., 2023). This shift in social and cultural norms has also transformed leisure activities, with many seeking pet-friendly vacation options. Consequently, the tourism industry is adapting, creating more spaces where pets are welcome, including hotels, restaurants, and shopping centers. This adaptation is reflected in the growth of the pet travel services market, which is projected to increase from $1.85 billion in 2023 to $3.02 billion by 2028, representing a significant growth opportunity for the hospitality and tourism sectors. This trend underscores the need for targeted policies and infrastructure to support the expanding role of pets in travel and leisure. Despite growing demand for pet travel and market expansion, most research has primarily focused on restrictions rather than how the relationship between pet owners and their pets influences travel decisions (Dilek et al., 2020; Joo et al., 2023; Taillon et al., 2015). While pet-related tourism studies have traditionally been centered in Western countries, interest has recently expanded to Asia (Tang et al., 2022), reflecting a broader shift in pet welfare awareness, as seen with Korea's early 2000s animal protection efforts (Podberscek, 2009). This study explores how pet owners' travel motivation, attachment to their pets, and perceived value impact their travel behavior and policy support. We will utilize the Lexington Attachment to Pets Scale (LAPS) (Johnson et al., 1992) to determine if it effectively captures the relationship between Korean pet owners and their pets and assess the impact of these relationships on behavioral intentions and policy support through a multi-method approach. By analyzing different tourism motives, we aim to make academic and practical contributions to the field by highlighting variations among different groups.

LITERATURE REVIEW AND RESEARCH MODEL

The cultural difference of pet attachment

Pets are increasingly recognized for their mental and physical health benefits to humans and for being considered family members, not just animals (Amiot et al., 2016). In Western cultures, where pet culture is more established, there is a rich body of research on human-animal interactions and bonds (Albuquerque et al., 2023). Conversely, in South

Korea, the acknowledgment of pets as family members is more recent, with significant shifts in public attitudes toward pets occurring since the 1990s (Kim et al., 2020; Dugnoille, 2014). As the pet-related market expands, so does research across fields like welfare and psychology, increasingly focusing on the significant emotional attachments between humans and pets (Jung & Ahn, 2021). These studies underline the profound impact of pet attachment on human well-being, highlighting a global cultural shift in how pets are perceived and valued (Amiot et al., 2016). Culture profoundly influences lifestyle, including human-pet relationships, which vary significantly across cultural contexts (Amiot et al., 2016). In Western cultures like the US and Europe, pets are commonly viewed as family members, while in South Korea, perceptions have been shifting only recently, with the consumption of dog meat banned and ongoing changes in the societal view of pets as food (Dugnoille, 2014). This study employs the Lexington Attachment to Pets Scale (LAPS), a widely used tool to assess human-pet attachment, which includes sub-factors like 'General attachment,' 'Substitution of people', and 'Animal rights/welfare.' The LAPS has been validated in various cultural settings, showing high reliability in Mexican (Ramírez et al., 2014) and German samples (Hielscher et al., 2019), and was adapted for Brazil with positive results (Albuquerque et al., 2023). However, in Korea, the LAPS presented a single-factor structure (Jung & Ahn, 2020), highlighting how cultural differences affect the perception and measurement of pet attachment.

Necessity of Segmentation of Tourism Motivation

Motivation is a critical determinant of travel decisions and behaviors in tourism, often used to understand and segment tourist behaviors (Park & Yoon, 2009). Despite its widespread application in tourism research, there needs to be more in understanding the specific motivations of pet travelers, whose motivations are influenced by their relationships with their pets and their desires for new experiences (Tang et al., 2022). Pet travel motivation encompasses the psychological interactions between pet owners and their pets, significantly influencing travel behaviors. Pet owners report feeling happier and more relaxed when traveling with their pets, which fosters a desire for shared experiences and relaxation outside their daily routines (Kirillova et al., 2015). Understanding these motivations is crucial for improving pet travel services and formulating appropriate policies (Chen et al., 2012). Market segmentation based on psychographic variables like motivation can capture tourists' desires and behaviors effectively. However, existing studies on pet travel segmentation are limited and often need to fully explain the behavioral reasons behind pet travel (Joo et al., 2023; Tang et al., 2022). This study aims to deepen the understanding of pet travelers' behaviors by exploring pet travel motivations and applying various variables to identify distinct behavioral characteristics of pet travelers.

Value Perception and Behavior Intention of Traveling with Pets

In pet travel, the value of the tourism experience is created through the interaction between the pet owner and the pet (Wei et al., 2023). While tourists' value perceptions have been studied as an antecedent variable to explain tourists' attitudes and behaviors (Lin & Huang, 2012), value research on pet travel is still scarce. Value research on traveling with pets has mainly focused on emotional and social values and only briefly examined the impact of attachment (Wei et al., 2023). In this study, we also highlight the importance of functional values (Chen et al., 2012) that arise from the tourism experience. We expect that pet travelers' behavior and support will be influenced by psychological factors such as attachment and value perceptions. Furthermore, although research on the relationship between motivation to travel with pets and travel behaviors and support is somewhat limited, prior research suggests that highly motivated individuals are more likely to travel with pets (Levitt et al., 2019). Psychological factors such as attachment and value perceptions have been used to predict tourist behavior, but there is less research on predicting support (Erul et al., 2020). The more emotionally close and empathetic people feel to tourism development, the more supportive they are of it (Erul et al., 2020). In this study, we distinguish between behavioral intention and support intention to more precisely measure and understand individuals' psychological responses to traveling with pets. Explaining such multifactorial social phenomena requires a complex analysis of variables (Olya & Gavilyan, 2017). Using fsQCA based on complexity theory is considered an excellent way to understand tourists' behavior (Kahraman et al., 2023). The results of this study are expected to contribute to understanding the characteristics of pet travelers and provide a new perspective on pet travel by analyzing the combination of perceived value and attachment. To this end, we present the fsQCA research model as shown in Figure 1 below, which is presented as a Venn diagram due to the nature of the model, which deviates from the traditional statistical approach (Olya & Gavilyan, 2017).

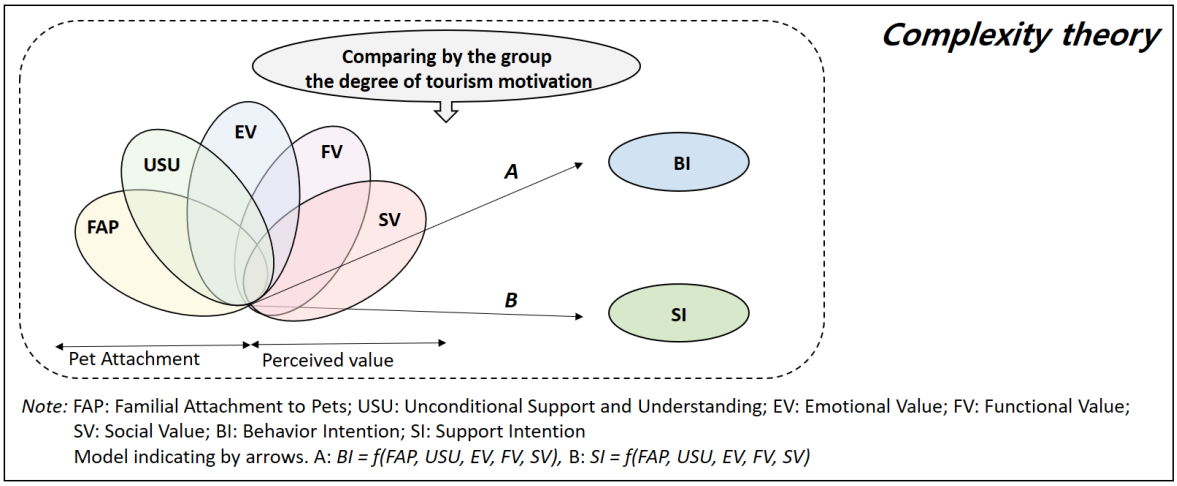

Figure 1. Research model

METHODS

This study applies complexity theory to examine phenomena using predictors like pet attachment, perceived value, behavioral intention, and support intention, highlighting the importance of non-linear, multi-factor interactions. The attachment scale, adapted from Johnson et al. (1992), was simplified for Korean respondents, resulting in ten items on Familial Attachment to Pets and three on Unconditional Support and Understanding. Value perceptions were measured using Lin and Huang's (2012) Emotional, Functional, and Social value scales, consisting of four, four, and three items, respectively. Behavioral intentions were gauged through four items from Huang and Hsu (2009) and Choi (2020), while support intentions were assessed with five items from Erul et al. (2019). The survey utilized a 7-point Likert scale, facilitating various statistical methods for analyzing ordinal data (Prentice et al., 2021).

The study was conducted among pet owners aged 20 and older living in South Korea. We added a screening question before the survey to determine if they live with a pet. To ensure the validity of the survey questions, we reviewed them with professors and experts in the field of tourism and conducted a pilot test with 30 pet owners in South Korea before launching the final survey. We then collected data through Embrain, a marketing research firm with the largest panel in Korea. To ensure the sample's representativeness, 492 samples were collected using a quota sampling method that considers gender, age, and residential area based on pet households in Statistics Korea's '2020 Population and housing census' report. After collecting survey responses, we excluded non-responses, including reverse-coded questions, and a final valid sample of 472 respondents was collected for analysis. All respondents received monetary compensation for completing the survey. The gender breakdown is 30.3% male and 69.7% female, with the most significant proportion of respondents in their 30s (33.7%). The highest monthly income was between 2 million and 2.999 million KRW (33.7%). Single respondents (56.4%) are slightly more likely to marry than married respondents (41.3%), but the difference is insignificant. 76.7% of respondents have traveled with a pet, and 85.0% of dogs are small dogs weighing less than 10 kg.

Before analyzing the data, preliminary checks on reliability, validity, and cross-tabulation were conducted. The study applied complexity theory using fsQCA to create an asymmetric model of the constructs (Ragin, 2008). Initial analysis included a two-stage cluster analysis based on pet travel motivation, followed by confirmatory factor analysis (CFA) with PLS-SEM to test the applicability of the LAPS scale to a Korean sample, which failed to establish discriminant validity. Consequently, exploratory factor analysis with varimax rotation was conducted using SPSS to reassess the LAPS scale's construct validity. Further analysis with PLS-MGA in Smart PLS evaluated differences between groups and relationship dynamics, while a three-step fsQCA identified effective condition configurations for outcomes. This multi-methodological approach aimed to provide a detailed examination of the underlying relationships and group differences in the study.

RESULTS

Reliability and validity

The results of the CFA can be found in Table 1. All items loaded significantly under the assigned factor, and the factor loadings met the recommended level (P<.001). In addition, the variance inflation factor (VIF) was checked to verify the multicollinearity of the variables, and the outer range of the VIF was between 1.252 and 4.971, which is less than the threshold of 5, confirming that multicollinearity is not a problem (Hair et al., 2017). Reliability and validity were confirmed for all constructs. Cronbach's α, rho-a, and composite reliability (CR) values all exceeded the recommended levels (>.7, >.7, >.7), and average variance extracted values were higher than the recommended values (>.5). These results show that the dataset has good quality characteristics (Hair et al., 2017). We also tested discriminant validity using the Heterotrait-Monotrait Method, which is accepted (Hair et al., 2017). Finally, we checked the endogenous variables' predictive relevance using Q2 values, which showed predictive relevance ranging from .566 to .666.

Table 1. Confirmatory Factor Analysis and Normality.

Constructs	λ *	t-value	Kurtosis	Skewness	VIF**
Familial Attachment to Pets (FAP)					
FAP1. I feel that my pet is part of my family	.841	56.748	2.448	-1.668	3.316
FAP2. My pet makes me happy	.854	66.710	1.144	-1.249	3.425
FAP3. My pet means more to me than any of my friends	.822	44.524	.459	-1.084	2.716
FAP4. I consider my pet to be a great companion	.838	42.404	-.019	-.902	2.922
FAP5. I am not very attached to my pet	.772	34.674	3.673	-2.027	2.565
FAP6. I think my pet is just a pet	.750	28.496	.075	-.949	2.093
FAP7. My pet and I have a very close relationship	.820	4.723	.109	-.944	2.636
FAP8. I believe my pet is my best friend	.793	31.403	1.601	-1.192	2.508
FAP9. I would do almost anything to take care of my pet	.783	39.181	.059	-.714	2.518
FAP10. I play with my pet often	.738	28.891	.450	-1.063	2.021
Unconditional Support and Understanding (USU)					
USU1. My pet understands me	.889	64.999	-.448	-.367	1.822
USU2. I love my pet because he/she is more loyal to me than most of the people in my life	.659	12.238	.094	-.797	1.252
USU3. My pet knows when I am feeling bad	.853	45.156	-.203	-.574	1.677
Emotional value (EV)					
EV1. Traveling with a pet makes me feel comfortable	.893	69.196	-.520	-.465	3.313
EV2. Traveling with a pet gives me emotional stability	.936	161.126	-.332	-.524	4.422
EV3. Traveling with a pet is enjoyable	.895	76.519	-.224	-.650	2.717
EV4. Traveling with a pet is an action that relieves stress	.742	24.269	-.017	-.308	1.634
Functional value (FV)					
FV1. Traveling with a pet is worth the time investment	.938	138.179	.532	-.895	4.971
FV2. Traveling with a pet provides me with new experiences	.899	87.216	.183	-.760	3.259
FV3. Traveling with a pet is worth the experience	.921	102.857	.575	-.886	4.053
FV4. Traveling with a pet is worth the cost	.800	35.043	-.065	-.489	1.824
Social value (SV)					
SV1. Traveling with a pet attracts other people's attention	.867	32.203	-.433	-.304	2.343
SV2. Traveling with a pet gives a good impression to others	.921	77.579	.106	-.085	2.319
SV3. Traveling with a pet makes me stand out	.870	41.179	-.410	.139	2.119
Behavior Intention (BI)					
BI1. I intend to bring my pet on future trips	.907	51.785	1.973	-1.346	3.769
BI2. I am willing to pay for the costs associated with bringing my pet	.928	106.041	2.099	-1.235	4.185
BI3. I intend to share information about traveling with pets with others	.846	43.616	.732	-.866	2.523
BI4. I will speak positively about traveling with pets to others	.918	77.242	.828	-.990	3.603
Support Intention (SI)

Note: * λ : Factor loading; **Variance inflation factor of multicollinearity.

Cluster analysis

A two-stage cluster analysis categorized pet travel motivations into three groups. Initial hierarchical analysis using the Ward method and Euclidean distance squared suggested three clusters, confirmed by non-hierarchical K-means analysis. Cronbach's α of .957 indicated high reliability for the nine motivation measures. Table 2 shows the clusters as follows: High Motivation (HM), 44% of participants, who travel for the well-being and enjoyment of themselves and

their pets; Moderate motivation (MM), 43%, who value spending time with pets but have moderate travel motivation; and Low Motivation (LM), 13%, who show minimal interest in traveling with pets.

Table 2. Mean responses of motivations of traveling with pets.

Construct	Cluster 1: High Motivation	Cluster 2: Moderate Motivation	Cluster 3: Low Motivation
	n = 208	n = 203	n = 61
Psychological Motivation			
I travel with my pet for the physical and mental well-being of both myself and my pet	6.09	4.53	2.49
I travel with my pet to alleviate stress and tension for both myself and my pet	6.09	4.34	2.34
I travel with my pet because both of us need to rest	6.21	4.63	2.44
I travel with my pet because I need a change from our daily routine	6.13	4.55	2.33
I travel with my pet to form a close bond with them	6.09	4.45	2.15
Experiential Motivation			
I travel with my pet to spend enjoyable time together	6.61	5.39	2.95
I travel with my pet because I believe we both need diverse experiences	6.29	4.70	2.39
I travel with my pet to appreciate beautiful landscapes together.	6.26	4.72	2.34
I travel with my pet to experience the special atmosphere of a resort destination	5.79	4.25	2.16

The discriminant analysis confirmed the accuracy of the three pet travel motivation clusters with a 96.6% hit rate and significant canonical discriminant functions. While no significant differences were found in gender, income, or pet size among the clusters, age, marital status, and pet travel experience differed. The High Motivation group, predominantly younger, more frequently had travel experience with pets. In contrast, the Low Motivation group, mostly middle-aged or older, tended to lack pet travel experience. The HM and Moderate Motivated groups had a higher proportion of married individuals, reflecting the more significant logistical considerations involved in traveling with pets.

Structural model and Multi-group analysis

PLS-SEM and PLS-MGA analyses revealed varying impacts of motivational factors on behavioral and support intentions across different pet travel motivation groups (Henseler et al., 2009), as shown in Table 3. Family attachment significantly influenced behavioral intention in the high and moderate motivation groups, whereas emotional and functional values were significant across all groups. Interestingly, social value negatively impacted the low-motivation group only. Family attachment and functional values were significant across all groups for support intention, but unconditional support, understanding, and emotional values were not. Social values significantly influenced only the moderate motivation group. Further nonparametric testing using Henseler's MGA and permutation tests confirmed these trends but showed distinct patterns in the influence of family attachment and functional values between different groups. Notably, emotional values significantly varied between the moderate and low motivation groups and functional values differed significantly between both the high and moderate groups, as well as between the low and moderate groups. Family attachment's impact on behavioral intention also showed a significant difference between the high and low-motivation groups.

Table 3. MGA findings.

Results from the fsQCA

The fsQCA results displayed in Tables 4 and 5 illustrate the impact of a varied mix of pet attachment (familial attachment, unconditional support, understanding) and perceived values (emotional, functional, social) on behavioral and support intentions (Pappas & Woodside, 2021). Specifically, the high-motivation group shows strong behavioral intentions when combining family attachment and functional and emotional values (Solution 2: FAP*FV*EV with high coverage and consistency). This group also responds positively to different combinations involving family attachment and values, even without unconditional understanding, which suggests flexibility in the factors driving their behavior. In contrast, the moderate and low motivation groups are characterized by fewer combinations but greater consistency in influencing behavioral intentions. For example, the moderate group is notably influenced by combinations like family attachment without unconditional understanding paired with value perceptions (Solution 3: USU*EV*FV*SV), showing solid intentions to travel with pets. The low motivation group demonstrates that even in the absence of solid pet attachment, functional and emotional values alone can effectively trigger behavioral intentions (Solution 2: ~FAP*~USU*EV*FV). These findings underscore that while pet attachment enhances behavioral intentions, it is optional, especially for those with lower motivation, where perceived values alone may suffice.

Table 4. Sufficient causal configurations for behavior intention.

solution coverage: .748			
solution consistency: .841			

Note: Bold means a parsimonious solution

Table 5 reveals how condition combinations influence support intentions similarly to behavioral intentions. For the high motivation group, a key variable is the combination of functional value, family attachment, and unconditional understanding, with solution 4 (~USU*FV*EV*SV) showcasing the highest consistency (Coverage: .305, Consistency: .899). This indicates that acknowledging fundamental values can significantly encourage support among highly motivated individuals, even without unconditional understanding. The moderate motivation group displays a broader range of influential combinations than seen in behavioral intentions, suggesting a more complex interaction of factors driving support. Notably, combinations lacking social values, including family attachment and functional or emotional values, are critical (Solution 7: FAP*USU*EV*FV), resulting in high consistency and coverage (Coverage: .528, Consistency: .929). This implies that the moderate motivation group strongly values emotional and functional aspects when coupled with familial and unconditional understanding. The critical variables for the low-motivation group are familial attachment and functional value. Their significant combination (Solution 2: FAP*USU*EV*FV) achieves high consistency and coverage (Coverage: .549, Consistency: .914), indicating that emotional and functional values effectively enhance support when linked with family attachment and understanding. Additionally, family attachment alone is sufficient for this group to elicit strong support, as shown in solution 3 (FAP*~USU*~EV*~FV*~SV), underscoring a more straightforward set of factors needed to increase endorsement among those with low motivation.

Table 5. Sufficient causal configurations for support intention.

Conclusions and discussion

This study challenges traditional perspectives on pet travel by exploring the impact of familial attachment, perceived value, and other factors on travel intentions and support for pet travel. It shows that familial attachment significantly enhances travel intentions for those strongly emotionally bonded to their pets, though it has a limited effect on those with low tourism motivation (Hidalgo et al., 2023). The study also finds that while unconditional pet support alone does not affect travel intentions, it becomes influential when combined with other factors. Key findings indicate that functional and emotional values are crucial, with practical aspects of pet travel as primary motivators across different groups (Lin & Huang, 2012). However, the influence of social value varies depending on the level of tourism

motivation. The fsQCA analysis reveals diverse factors influencing pet travel intentions, suggesting the need for nuanced marketing strategies that reflect these varied motivations and value perceptions (Yu et al., 2023). Additionally, this research applies the Lexington Attachment to Pets Scale (LAPS) to an Asian context, highlighting cultural differences in pet attachment and the need for culturally sensitive research tools (Albuquerque et al., 2023; Hielscher et al., 2019; Johnson et al., 1992; Jung & Ahn, 2020; Amiot et al., 2016). This study not only contributes to the academic understanding of pet travel but also offers insights for practical applications in marketing and policy within the pet travel industry, suggesting that a complex array of emotional, functional, and cultural factors influences consumer behavior.

This research underscores the practical implications for policymakers and industry stakeholders in the pet travel industry by highlighting the significance of familial attachment and functional value in shaping travel intentions. It recommends promoting the familial bond between pets and their owners to enhance demand for pet-related travel services. It suggests establishing pet-friendly environments that reflect family values to support the industry further. Additionally, it points out the necessity for improved pet travel infrastructure and policies that facilitate better travel experiences for pet owners, such as more inclusive guidelines for pets in public spaces and transportation and better access to travel-related information for pet households (Kim et al., 2020; Tang et al., 2022). The study also reveals that variations in travel motivation significantly affect pet owners' attachment levels and perceived values, influencing their behavioral and support intentions. It advises tailoring strategies to these different motivational levels, using targeted promotional and infrastructural approaches to meet diverse needs. This approach enables the development of policies and business strategies that resonate with pet owners' varied experiences and expectations, promoting growth and sustainability in the pet travel market. While the research provides valuable insights, particularly for the Korean and broader Asian contexts, it acknowledges limitations, such as its focus on regions where pets are recently recognized as family members, which may not fully represent global perspectives on pet ownership. Future studies are encouraged to explore pet travel in various cultural and social settings to build a more rounded international understanding of pet travel dynamics. The research also suggests that further studies could explore additional variables affecting pet owners' behavioral intentions and support for pet travel to deepen the understanding of the intricate factors influencing pet travel decisions.

PERCEPTION OF USAGE, BOONS AND BANES OF ARTIFICIAL INTELLIGENCE BY LOCAL TOURISTS FOR PROMOTING CLIMATE ACTIONS FOR A SMALL ISLAND DEVELOPING STATE

Adjnu Damar Ladkoo
University of Mauritius
Department of Management
Reduit, Mauritius

ABSTRACT

Despite some drawbacks, artificial intelligence (AI) extends the possibility to fulfil tasks intelligently via enhanced cognitive abilities. The study aimed to capture views and perceived pros and cons of using AI for promoting climate actions. The study's context was Mauritius, a climate-vulnerable Small Island Developing State. With an interpretivist approach, 15 local tourists were interviewed. Thematic analysis led to the emergence of themes showing that the use of AI for promoting climate actions is still in its infancy, with skepticism. The predictive capacity and knowledge-sharing ability of AI were boons identified while its energy consumption and carbon emissions were the banes.

Key Words: Artificial, Intelligence, Climate, Actions, Islands, Tourists.

INTRODUCTION

Artificial intelligence (AI) is gradually altering the practices of many service providers. This has offered transformative possibilities in how services can be created, provided and managed, thereby extending an unconventional set of enhanced values. AI is one breakthrough innovation that has taken the nooks and corners of every businesses. As per Ellis *et al*. (2019) disruptive novelty can be labelled as a creation that disrupts a current market by introducing a new notion or know-how that provides a different set of values. AI is one such technology which can today be used to combat crucial issues like climate change. Many countries, but mostly climate-vulnerable Small Island Developing States (SIDS) like Mauritius, Maldives and Seychelles, are in baffling situations of identifying apt climate measures to overcome the harsh impacts of climate change on them. SIDS are bearing the brunt of climate change when their contribution to this crisis is disproportionately small. The latter are paying a big share of climate impacts because the climate variability and climate change are hitting SIDS in different ways and in diverse of their sectors in very unfair manners. The study focuses on one such SIDS, Mauritius, which has pledged to heighten its climate actions despite the above prejudicial situation. One of its highly tormented industry due to the climate crisis is the tourism sector. While local or global proponents of climate actions are providing a diversity of climate solutions to mitigate the effects of climate change by cutting down on their carbon emissions, few have thought of using the disruptive technology, AI, to combat the climate crisis. Willingness of decision-makers to capitalize on AI to promote climate actions is one thing while the reality also seeks to address the issue of utilizing the benefits of AI to its fullest while having the ability to evade its negative bearings. One of the key stakeholders of the tourism sector is the tourists, also known as the beneficiaries of the tourism products and services. This study focused on one such stakeholder- the local tourists- due to them being both the benefactors as much as being the offerors of tourism products and services. While climate actions are created, they also have to be promoted so as to motivate and inspire people to have: awareness, learn, feel interested about them to eventually appeal for them and adopt those climate actions when required. Thus the emphasis of this research was more on the promotional need for climate actions. As such, the objectives of this study were: 1) to capture the views of local tourists about the use of AI for promoting climate actions of a SID, and 2) to determine the pros and cons perceived by local tourists regarding the use of AI for promoting climate actions of a SID. The layout of the paper is as follows: a literature of key topics like use and perception of AI as well as climate actions and SIDS followed by the research methodology, findings, discussions and a concluding paragraph.

LITERATURE REVIEW

The use of AI can contribute to battle against the climate disaster and existing AI systems involve tools that can forecast weather, map icebergs and detect pollution (Masterson, 2024). Amongst the several studies which have been dedicated to the use of AI for combating climate change are those of: Smith and Anderson (2024), Cowls *et al*. (2023), Kaack *et*

al. (2022), Leal *et al*.(2022), Stein (2020), Luccioni *et al*. (2021) and Huntingford *et al*. (2019). For Steyvers and Kumar (2023) even if the body of empirical enquiries on AI-assisted decision-making continues to expand, there is still much to discover. For instance, studies focusing on the use of AI in specific areas such as tourism and how specific issues like climate change are impacting on the latter, are minimal. Tong *et al.* (2022), Jabeen *et al.* (2022), Filieri *et al* (2021), Li *et al.* (2021) and Bulchand-Gidumal (2022) are amongst the recent studies which focused on AI and tourism. Very scantily-present new studies which amalgamate not only tourism and AI, but also climate actions, are those of Khan *et al*. (2024) and Loureiro *et al.* (2021). Lesser has been researched where climate, AI, tourism and small islands have been combined; such as that of Makoondlall-Chadee *et al*. (2021). There has always been a connection between climate and tourism- whether the latter is contributing to or is impacted by climate- the bonding has been ever-present. While today, the climate crisis is ravaging much of the tourism development in small islands, identifying apt climate actions together with key participants of the sector is primordial. Hence, to narrow the gap of minimal studies uniting arenas like tourism, AI, small islands and climate change, the present study was conducted. For Wolf *et al*. (2022) the effects of climate change are drastically minimizing the appeal of disaster-vulnerable SIDS which amongst others, are stressing touristic resources. Tourists visit SIDS mainly for their sun, sand, and sea, which are the main drivers of tourism for such destinations. While some tourism developers have proactively diversified and shifted tourism attractions to inland beauties of the islands, they are still facing the dilemma of climate change such as more unpredictable intensities of cyclones, heat waves, heavy rainfall and flash floods, which are affecting the whole island. While the main stakeholder- tourists- may not object to shift from the sun, sand and sea towards inland attractions, the climate crisis stays an unresolved mystery. As per Ladkoo (2020) tourism is in dire need of identifying eco-friendly and sustainable development strategies due to the severe impacts of climate change. As such, AI is one technological advancement that can help increase the resilience of SIDS. However, for effective acceptance and adaptation to new AI-generated climate actions, it is vital to comprehend how the main participants perceive the usage of AI to combat climate actions in SIDS. As per Grundner and Neuhofer (2021) AI has been declared as a life-changing innovation to mankind whereas strong projections of the application of AI within the present-day service environment are not much understood. Two challenges associated to this study are perception-based, that of climate change and that of AI. As per Luccioni *et al*. (2021) cognizance and apprehension of people about climate change do not equate its level of danger to human beings and the surroundings. This fortifies the study's need to incorporate local tourists who, while being existing inhabitants are experiencing the impacts of climate change on their island, are simultaneously empathetic about the effects of climate change on the tourism sector by being recipients of the tourism offerings from their island. Thus, this study assumes that local tourists are aware and understand the impacts of climate change; leading to a more neutral capture of local tourists' perception of AI usage for climate actions in SIDS. The heightened impacts of climate change are pressurizing environmental and tourism authorities of SIDS to adopt right climate actions with regards to sustainable tourism developments and hence, this paper extends that AI may be a plausible tool to use for achieving such goals. Thereby, proposing a research methodology that will help explore and dig deeper into the above topic.

RESEARCH METHODOLOGY

Social viewpoints and notions emerge from interpretive approaches given that they are socially formulated or made significant through the actors' comprehension of happenings (Putnam and Banghart, 2017). The interpretive paradigm discards the reductionist nature of quantitative information and in its place centers on the intricacies and tones integral in human interpretation, recognizing that realism is not a permanent thing but is molded by the varied viewpoints of entities in a society (Acharya, 2024). The study used the interpretivist approach so as to delve into such new exploratory topics like AI, climate change and SIDS. Through purposive sampling, 15 local tourists were interviewed. For Rai and Thapa (2015) purposive sampling is also known as judgmental, selective or subjective sampling which depends on the researcher's evaluation regarding units to be considered such as the respondents of the study. As the topics are rather new and complex, working adults with at least a higher school certificate were targeted. For Peel (2020) broad subject discussions are directed by queries that contribute in centering the discussion, advancing tentative elucidations and working the recognized areas into the exchange. The set research and interview questions were as follows: research question 1- what are your views about the usage of AI for promoting climate actions, research question 2- what can be some of the advantages for using AI to promote climate actions, and research question 3- what can be some of the disadvantages for using AI to promote climate actions? Ethical principles such as informed consent, confidentiality and anonymity were abided by. An identification code was assigned to each respondent such as R1 for respondent one. As per Vaismoradi *et al*. (2016) while engagement with existing literature prior to data collection is the characteristic of most qualitative methods, it is strongly suggested that an in-depth literature review is postponed until after most data collection is completed to prevent introducing bias and perceived notions. The same principle was considered for this study. Ironically, while it is vital for a researcher to immerse in the qualitative data set for proper understanding, the latter has to also detach himself so as to objectively analyze and report the findings. More so, to allow the capture of neutral responses without the incorporation of researcher-bias, the bracketing principle was also

considered and prompting was used only when deemed appropriate. These were 3 important challenges, which were carefully worked upon for this study. Thematic analysis was used and as per Braun and Clarke (2006) thematic analysis is a method for finding, scrutinizing and reporting patterns (themes) within data. As per Lumivero (2023) thematic analysis entails generating logic of what the interview contributors said such as: their main ideas, appalling view points, and differences or similarities of ideas. A collection of similar ideas from one or more participants were generated and captured by reading and re-reading of transcripts while also highlighting common answers in a similar colour for clear demarcations of themes as shown in table 1 and 2. The sentence-to-sentence analysis was used so as not to miss out important details in comparison to the paragraph-to-paragraph analysis.

Table 1
Excerpt of Coding Of Themes for Research Question 1
Source: Author-Generated

Respondent ID	**Research Question 1: What are your views about the usage of AI for promoting climate actions?**		**Themes**
	Column showing prompting/s used		
R1		AI is a very new technological thing so I doubt how will it tackle yet another new emerging problem like climate change.	Doubtful
	Prompt 1: Both AI and climate change may be new but if we were to use AI , what would be your perception on this?	It can be too advanced that it may not fit the present context's need. Data is needed to feed the AI so relevant and hands-on data needed.	Too advanced AI is data-driven
R2		I do not know much about how to use AI for this purpose because climate change is more of a natural phenomenon	Doubtful AI is unnatural
R3		AI is all about information and algorithms. So only good data can give good output.	AI is data-driven
	Prompt 1: To what data are you referring here?	Data on emissions and environmental changes	Environment Carbon emission

Table 2
Excerpt of Coding Of Themes for Research Question 2
Source: Author-Generated

Respondent ID	**Research Question 2: What can be some of the advantages for using AI to promote climate actions**		**Themes**
	Column showing prompting/s used		
R13		Can AI autonomously solve a complex issue like climate change? No. If it helps it will be with predictions weather or related-environmental problem discoveries. But not sure.	Help in climate prediction

R14		It can help to have a more dynamic view of the climate problem because each country is different so if AI can assist in giving customised solutions for climate change, which will be great.	AI helps to have dynamic view of climate change AI can assist with customised solutions for each country
R15		I think in terms of knowledge generation via its ease of predicting things about weather.	Knowledge gain and sharing Help in climate prediction

FINDINGS AND DISCUSSIONS

Table 3 depicts all the themes that were captured from the analysis of the transcripts. The coding process led to the capture of 12 different themes with regards to perception of usage of AI to promote climate actions while 9 and 10 different themes were captured for the advantages and disadvantages, respectively.

Table 3
Themes captured for all research questions

Views about usage of AI to promote climate actions		**Perceived advantages of using AI to promote climate actions**		**Perceived disadvantages of using AI to promote climate actions**	
Theme captured	**Number of times captured**	**Theme captured**	**Number of times captured**	**Theme captured**	**Number of times captured**
Doubtful	7	Help in climate prediction	6	High energy consumption	5
AI is data-driven	6	Knowledge gain and sharing	3	Greenhouse gas emission	4
AI can help	3	Mapping natural assets	2	Output is fed-data dependent	4
AI is unnatural	2	Aid tourism planners	2	Lack of knowledge about AI	3
Humans predictions better with good data	2	Do not know	2	Human-dependent	2
AI is costly	1	Transformative approach to combat climate change	1	Costly	2
AI is invasive	1	Dynamic view of climate change	1	Need for experts	2
AI is too advanced	1	Assist with customised solutions for each country	1	AI is intrusive	1
Training about AI needed	1	Discover patterns of weather	1	Possibility of fake predictions	1
Controlled use of AI	1			Need to leverage AI's use	1

Lack of knowledge on AI	1				

The two themes that were principally captured with regards to views of usage of AI to promote climate actions were: 1) doubtful and 2) AI is data-driven. With regards to the theme 'doubtful' for instance, R5 and R12 stated the following respectively: *The name itself has artificial. So I do not think it can solve human-related problems in a natural way* and *AI is a new thing. I am not so sure it can help to solve climate change.* With regards to the theme 'AI is data-driven' for instance, R11 stated the following: *AI is a technology which should just be there to help with some tasks. It should not take over the role of humans who are way more intelligent and they themselves are putting the information in those AI machines. So why need AI.* Clearly from the responses captured, it could be noted that there is a hesitancy of the acceptance of AI to aid a natural problem such as climate change. The fact that AI is similar to a machine functioning on data that are fed, was of concern for most of the respondents. For Nishant *et al*. (2020) AI cannot be a remedy for all our difficult ecological sustainability glitches. For the latter, true value of AI is not at a micro level but at a macro level such as how it can assist and promote ecological governance. Additionally, as per Yudkowsky (2008) human programmers are way smarter, cunning and creative than AI but flash forward in time, AI can become superhumanly intelligent and outsmart the programmers. For Cowls *et* al. (2023) AI can be biased as it normally learns from existing data to make predictions about new sets of data. As such, the captured views led to note that understanding about how to use AI for promoting climate actions is still in its relative infancy as most of the local tourists had uncanny feelings of AI being unnatural and heavily reliant on data loaded by humans. Apart from the above two major themes, an assembly of the other themes bagged about the usage of AI led to the understanding that the respondents were questioners of AI; though one theme captured three times showed that there was a feeling that AI could aid the sector and the climate crisis. As such the 'costs' associated to usage of AI could be felt and these have important implications and as per Gerlich (2023) acceptance and adaptation of AI technologies among policymakers and decision takers stay subjects deserving further search.

Two of the most prevalent themes for the advantages of using AI to promote climate actions were: 1) help in climate prediction and 2) knowledge gain and sharing. For Huntingford (2019) AI can construct on learnt climate connections to offer superior cautions of forthcoming weather features, including risky happenings. As per He *et al.* (2021) AI is progressively pooled with climate forecast and weather prediction. Climate-vulnerable SIDS like Mauritius which is experiencing heavy rainfall, sea level rise and harsh weather conditions, may have AI's support in better climate predictability. As per Abebe and Endalie (2023) AI has been extensively utilized in nearly all arenas, and rainfall forecast is one of them. For Singh (2023) AI can have a significant role in monitoring, forecasting and reducing climate change impacts like in helping to increase climate resilience and promoting sustainable ecological endeavours. Promoting climate change rest a lot on educating all concerned stakeholders and AI can have a key role in designing customized climate-related educational or training content adapted for targeted stakeholders. Education is central to promoting climate action (Muccione *et al*., 2023) and the tourism arena which is amongst those sectors that also contribute to climate change, has a duty to mold into a more sustainable industry for the benefit of all stakeholders. As per Khan *et al*. (2024) AI advances can make the tourism set-ups more proficient which can lead to prospects of sustainable progress and safeguard of the ecology like for instance in better energy management, waste minimization and leveraging of transport and resources through recommendation systems and virtual aides. While one theme which was captured twice showed that the respondents did not know much about the benefits of using AI for promoting climate actions, the majority yet, in diverse ways could recognize the potential of AI. This could be synonymous to partial acceptance of AI to promote climate actions because the earlier captured themes about the views of AI were showing more skepticism rather than appreciation of AI. For Gerlich (2023) elements such as trust, usage expansion, and observed weaknesses form community accord, portraying AI as humankind's benefit or nuisance.

With regards to the disadvantages of using AI to promote climate actions, high energy consumption and greenhouse gas emission, were the 2 most captured themes. As per Georgiou *et al*. (2022) the use of AI is energy consuming and adds to the surge in carbon dioxide emissions while also having consequent financial costs. For Wu *et* al. (2022) there has been the usage of massive computational power to progress the use of AI while neglecting resources and ecological footprints. As per Kindylidi and Cabral (2021) advanced research is needed to properly map the ecological bearings of AI and the acceptable levels of energy use and carbon emissions. In contrast, for König *et al*. (2022) people are barely concerned about the energy efficiency of AI and customers may pay attention to the environmental sustainability of AI if they are informed, not only of their sole individual behaviour but, of their total worldwide environmental bearings to which their individual behaviour contributes. For Kaack *et al*. (2022) there is great enthusiasm in how AI is impacting on the carbon emissions yet, such releases stay unsure due to the diverse mechanisms through which they happen, posing complications for assessment and estimation. Other themes depicting other less prominent banes of AI were the dependency of AI on human and on fed-data as well as the need for experts and the lack of information about AI.

Expenditure associated to use of AI and the intrusion possibility of AI were also other disadvantages. For Zhao *et al*. (2022) AI investigations and strategies are swelling but resources needed to support and promote the latter are also rising. Perceived banes of this study outweighed the perceived boons which was also reflected in initial general views captured about the use of AI to promote climate actions and this has been depicted in the figure 1. This part of the study confirms the possibility of having a possible dichotomy between perception and acceptance of AI to promote climate actions in the tourism field of SIDS.

CONCLUSION

This study contributes to the ongoing investigation of AI in diverse areas and the focus of this study was tourism and climate change impacting SIDS. Most notably, an incongruence between positive perception and sort of acceptance was found, which may require deeper investigation. This study will help practitioners and decision-makers of the tourism arena to orchestrate their organizational impetus towards sustainability with the help of AI, while also onboarding in their discussion the associated perceived drawbacks of AI. Appropriate and adequate exchanges between and among a diversity of stakeholders on the use of AI to combat climate change, have to be considered for discovering enhanced values as well as perceived banes of AI. As per Alami *et al*. (2021) to warrant effective incorporation of AI and evade unnecessary investments and costly failures, better consideration should be given to: (1) requirements and added-value calculation; (2) firms' readiness: stakeholder acceptance and commitment; (3) technology-organization orientation valuation and (4) business plan: funding and investments. With regards to the calculation of the perceived valence of AI, Steyvers and Kumar (2023) suggest that despite being a challenge, AI that aligns with human values and expectations have to be planned where utility functions that reflect human values exists. The latter further state that as of now, AI cannot autonomously make choices that are precise, tolerable, and reasonable to people so it is vital to incorporate a human decision maker's expertise and feedback along with an AI's computation when making resolutions. This study confirms a clear perceived dependency of AI on humans and human fed-data into the AI system. Based on existing studies, it is known that AI can also function all alone. Yet Dietvorst *et al*. (2018) showed that letting people to interpose in an algorithm's conclusion triggered the persons in question to raise the value of the algorithm more and made them more likely to use the system in the future although permitting the algorithm to make the decision without intervention would lead to better outcomes. SIDS currently have an urgency to find to-the-point climate actions that can help the tourism arena to circumvent and adapt to the climate crisis. For Verendel (2023) AI is scattering fast in diverse arenas and its developments may support climate change mitigation and adaptation. As per Huang and Rust (2018) using the four intelligences of AI- mechanical, analytical, intuitive and empathetic- opportunities for ground-breaking human-AI amalgamation in the service sector can exist which may however hamper human employment. For Loureiro and Nascimento (2021) from a practical standpoint, future interventions of AI should cultivate buy-in throughout the introduction phase of the new machine so as to be able to considerably affect the daily tasks of hospitality and tourism employees, by implanting a feeling of co-ownership, and by mounting appropriate training courses addressing their actual work setting or location sites. While the reading showed some perceived threats associated to the usage of AI to promote climate actions, the study also convinces to recognize apt optimized usage of

the latter- while having a balanced consideration of its banes and boons- for identifying proper climate measures for climate-sensitive countries like SIDS. Points advanced in this study may spur further in-depth research, discussion and enhanced quantitative investigations regarding the integration of AI in climate decisions for the tourism sector of SIDS. The study laid the foundation of researching about AI along with climate, tourism and SIDS and after critically uniting captured themes with other recent studies findings, endorses that AI can be a plausible solution to promote climate actions in SIDS for safeguarding not only the tourism industry, but other inter-related industries. The observed limitations of AI, which tend to outweigh the benefits should, however, be further scrutinized for a fair use of this trailblazing innovation.

DEVELOPING THE C.A.S. MODEL BASED ON FACTORS MOTIVATING MEDICAL TOURISTS' DECISION-MAKING PROCESS: A CONCEPTUAL LITERATURE REVIEW

Mahum Khawar
University College London
London, United Kingdom

Senika Dewnarain

University of Birmingham Dubai Dubai,
United Arab Emirates

ABSTRACT

The existing body of literature on medical tourism suggests that at present, there is no holistic conceptual framework to determine the motivations behind medical tourists' decision-making processes, from the initial cognitive recognition stage to the last supply stage. This study therefore proposes the CAS model to better gauge the stages of medical tourists' decision-making process. The model considers three distinct stages – cognitive intention, awareness and selection, and supply of medical tourism – to differentiate between customer motivations and supply-side motivations. It is recommended that future studies employ qualitative and cross-culture approaches to further analyse the model and its usability.

Key Words: medical, tourism, destination, decision-making, motivations, branding

INTRODUCTION

Background

Medical tourism can be defined as the process of travelling to a destination for the purpose of seeking medical attention and well-being (Ghosh and Mandal, 2018; Heydari et al., 2018; Rahman et al., 2022). According to Ghosh and Mandal (2018), the medical tourism industry has experienced exponential growth as a product of healthcare globalisation and neoliberal policies, due to factors such as affordable medical technology (Kim et al., 2019), cheaper transportation options (Kamassi et al., 2020), and effective marketing strategies from both tourism destinations and medical companies (Dang et al., 2020). Due to an augmented level of the aforementioned factors, destination branding has grown to become a prevalent trend in marketing. This can be attributed to effective marketing techniques to create tourism incentives by promoting a destination's value, image and service quality (Baker and Cameron, 2008). At present, the medical tourism market is valued at USD 47 billion (Yang, 2024). This is projected to exceed a market size of over USD 111 billion by 2029 (ibid, 2024). Therefore, medical tourism poses an attractive opportunity for marketers to leverage as a strategy for destination branding by better understanding tourists' motivations.

Motivations and Purpose

The burgeoning rise in the field of medical tourism calls for marketers to better gauge the motivational factors behind customers' engagement in medical tourism, and by doing so, adopt effective marketing strategies to counteract growing international competition (Garg et al., 2023). Despite ample research on factors that motivate medical tourism, there exists a gap in developing a holistic model that illustrates the interaction between the factors and decision-making process. Existing models have explored motivations from a variety of angles such as supply and demand (Heung et al., 2010), distribution channels (Caballero-Danell and Mugomba, 2007), stakeholder structure (ibid, 2007) and choice of country (Smith and Forgione, 2007). When adopting a holistic lens, however, there has been a lack of research, and therefore conceptual models, that illustrate the motivational factors to pursue medical tourism from the premature cognitive stages to the final supply stage. This constitutes the purpose of this paper: to develop a holistic conceptual model supported by pre-existing models and theories to explain the decision-making process.

LITERATURE REVIEW

Destination-Based Brand Equity

Aaker (1991) defines brand equity as the brand's assets and liabilities that relate to its name and symbol, which emphasise or reduce the value provided by the firm to their customers. While Aaker's (1991) customer-based brand equity (CBBE) concept primarily applies to physical goods from the customer's perspective (Guha et al., 2018), Rahman et al. (2022) find that the concept can be translated to destination-based brand equity (DBBE) through revisit intentions under various tourism scope forms. Aaker (1991) developed the CBBE model *(figure 1)* to propose six dimensions (i.e. salience, performance, imagery, judgements, feelings and resonance) that measure brand equity from the customer's point of view, however, further research has revealed that there are no universally set dimensions to measure brand equity against (Roy et al., 2022). Therefore, dimensions such as perceived benefits, products, culture and income can all constitute the destination's brand equity (Roy et al., 2018).

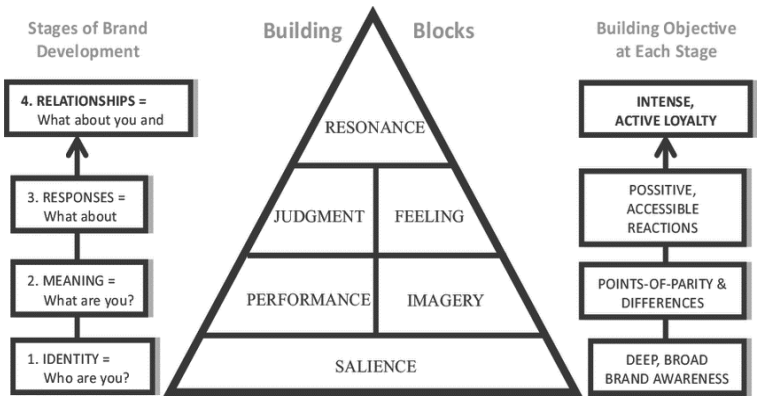

Figure 1: Aaker's (1991) CBBE Model

When considering the destination for medical tourism, DBBE variables such as perceived quality, brand awareness, brand loyalty, and brand authenticity play a pivotal role in the decision-making process (Rahman et al., 2022). Capar and Aslan

(2020) identified six factors that affect destination choice: quality of care, safety and security, potential for saving, tourism opportunities, hygiene level, and accessibility. While these account for the relatively tangible factors affecting customers' decisions, other intangible factors such as reliability and perceived benefits also play a role in the premature decision-making stages (Rahman et al., 2022). Therefore, a combination of DBBE variables and pre- purchase cognitive factors (i.e. perceived benefits, risk and resource availability) form the basis of the motivations and decision-making process in medical tourism. *Table 1* contains a list of countries and motivational factors leading to medical tourism in the respective destinations. The data suggests that quality is a recurrent theme in the motivations behind pursuing medical tourism, the implications of which will be discussed in the following sections.

Table 1: Key Motivational Factors Leading to Medical Tourism in the Respective Destination

Country	Medical Service(s) Provided	Key Motivational Factor(s)
Japan	Plastic surgery (Funakoshi et al., 2023) Orthopedic surgery	Minimally invasive technology providing high quality Low cost of care
United Kingdom	Orthopedic procedures Pediatric procedures (Brown et al., 2019)	Quality Cultural tourism
Korea	Beautification procedures (Boguszewicz-Kreft et al., 2020)	Quality Technology
United Arab Emirates (UAE)	Complex cosmetic procedures (Vally, 2018) Dental procedures (Alyasi et al., 2018) Fertility treatments	Quality Notable doctors in respective fields Luxury experience

Theories on Motivational Factors in Medical Tourism

Theory of Planned Behaviour

The Theory of Planned Behaviour (TPB) continuously underpins findings in medical tourism literature as it holds that intentions accurately inform and predict various behaviors (Ajzen, 1991). The author proposes that intentions include

one's motivation which shows the extent to which they are willing to behave a certain way, and the amount of effort they put into that behaviour (Ajzen, 2020), as shown in *figure 2*. Boguszewicz-Kreft et al. (2020) find that three factors constitute the user's intentions: attitude towards a behaviour, subjective norms, and perceived behavioral control. The first is a person's positive or negative assessment of a behaviour; the second is the social pressure exerted to engage in a certain behaviour; the last is the individual's subjective perception of the ease or difficulty to engage in a certain behaviour based on previous experiences and expected obstacles (ibid, 2020). Therefore, Paris and Van den Broucke (2008) emphasise the cognitive role the TPB plays in motivating medical tourism.

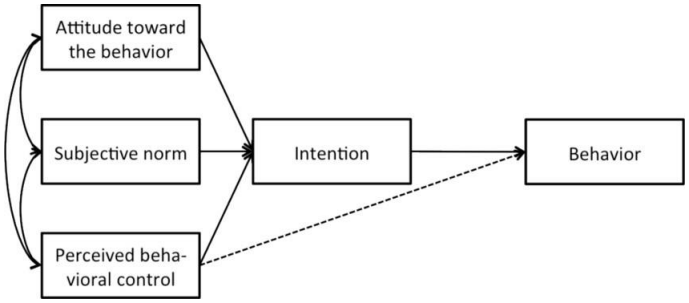

Figure 2: Ajzen's (1991) Theory of Planned Behaviour

Theory of Planned Behaviour Applied in Medical Tourism

Lee et al. (2012) applied the TPB to Japanese tourists and their intentions for engaging in medical tourism. It was found that attitude towards behaviour, subjective norms and perceived behavioral controls all played a role in the decision-making process, albeit unequally (ibid, 2012). This suggests that while all three elements that make up the intention and motivations can play a role simultaneously in the decision-making process, the type of medical treatment being received can outweigh a certain element with regards to the others (Boguszewicz-Kreft et al., 2020). In its wider implications, this highlights the importance of destinations accurately marketing their medical services to enhance the factor that serves their competitive advantage from one or more of the intention factors from the TPB. For example, one of the UAE's motivational factors was highly qualified doctors (*see table 1*). Reyna and Lloyd (2006) found that highly qualified medical practitioners deviated significantly from customers' perceived risk, therefore the customer's attitude towards the behaviour of engaging in medical tourism in the UAE would lean towards being assessed positively. Consequently, one of the UAE's competitive advantages would lie in its highly qualified medical practitioners being adapted into creative marketing strategies for destination branding.

Protection Motivation Theory

The Protection Motivation Theory (PMT) holds that in the context of medical tourism, threat description can affect the customer's cognitive process (Rogers, 1983). Therefore, Seow et al. (2022) argue that when a threat is identified, the cognitive process indicates a need for action, which is undertaken to resolve the issue and avoid negative consequences. Hence, in the context of medical tourism, when the customer is presented with a threatening issue (health problem), they undergo the cognitive process of performing an appraisal based on the perceived severity and vulnerability of the threat, to then determine whether they can cope by following with a coping appraisal (ibid, 2022). Seow et al.'s (2021) research found that upon perceiving high threat appraisal coupled with high response efficacy (coping mechanism), tourists were more intent on engaging with medical tourism, creating a direct positive relationship between the two variables. Hence, the PMT provides a solid basis to understand the conscious motivational process underpinning the decision to engage with medical tourism (Seow et al., 2021).

Models on Motivational Factors in Medical Tourism

Medical Tourists' Motivational Framework

Ye et al.'s (2011) research explored the motivations and barriers of medical tourists in Hong Kong. Their study is underpinned by the push-and-pull motivation theory, which holds that push factors are internal to the tourist and the prompting force causing them to travel, while pull factors are external as they affect the destination choice. Based on the theory, the authors developed a conceptual model for medical tourists' motivations, shown in *figure 3*. The framework was developed on key findings, including the identification of motivational factors in medical tourists being different to the motivations of regular tourists. While medical tourists were more motivated by medical factors, regular tourists were motivated by the attributes of the destination (e.g. sightseeing, cuisine, culture) (Ye et al., 2011).

Heung et al. (2010) criticised Ye et al.'s (2011) model on several grounds. The first limitation came from the study's limited sample size; therefore, the findings could not be generalised (ibid, 2010). Secondly, the study employed cosmetic surgery patients as the target market, therefore the model was developed according to the cosmetic procedure industry. Consequently, elements within the framework such as "attractive price of cosmetic procedures" would not be applicable to medical tourists looking into other areas of surgery (ibid, 2010), limiting the study's scope. Finally, the authors fail to account for the cognitive pre-purchase stage in the medical tourist's decision-making process as suggested by the PMT and TPB, where the threat and coping appraisal would typically occur. Given that the study focused on cosmetic procedures, Yan et al. (2020) found that perceived risks and threats play a key role in the customer's cognitive process when looking into cosmetic procedures, therefore making the cognitive stage even more of a key motivational factor.

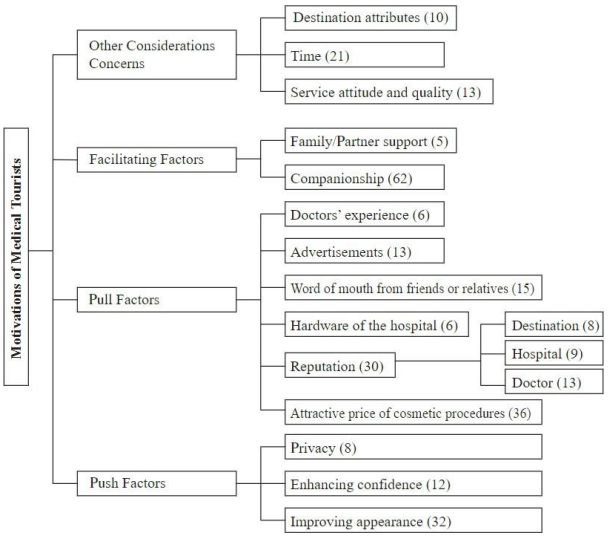

Figure 3: Medical Tourists' Motivational Framework (Ye et al., 2011)

Supply and Demand Model of Medical Tourism

To develop a more holistic and generalised model of medical tourism, Heung et al. (2010) proposed their Supply and Demand Model, shown in *figure 4*. The authors hold that there are two distinct parts in the customer's decision-making process – the demand side and supply side. Oberoi and Kansra (2019) found that the demand-side variables in the model were determined by a combination of sub-factors such as economic cost, distribution channels and distance to the location – all variables that dissociate from psychological motivations. Note that the model is initiated with a "Need for Medical Treatment" stage, which feeds into the advertising and distribution channels. Therefore, by overlooking the initial cognitive process of threat appraisal according to the PTM theory, Heung et al. (2010) do not provide a holistic view of the motivational process from the very beginning stages. The "Need for Medical Treatment" is informed by the PMT and TPB through cognitive variables such as threat appraisal and subjective norms. Therefore, Heung et al.'s (2010) theory, while generalisable, is limited in the holistic decision-making and motivational sense

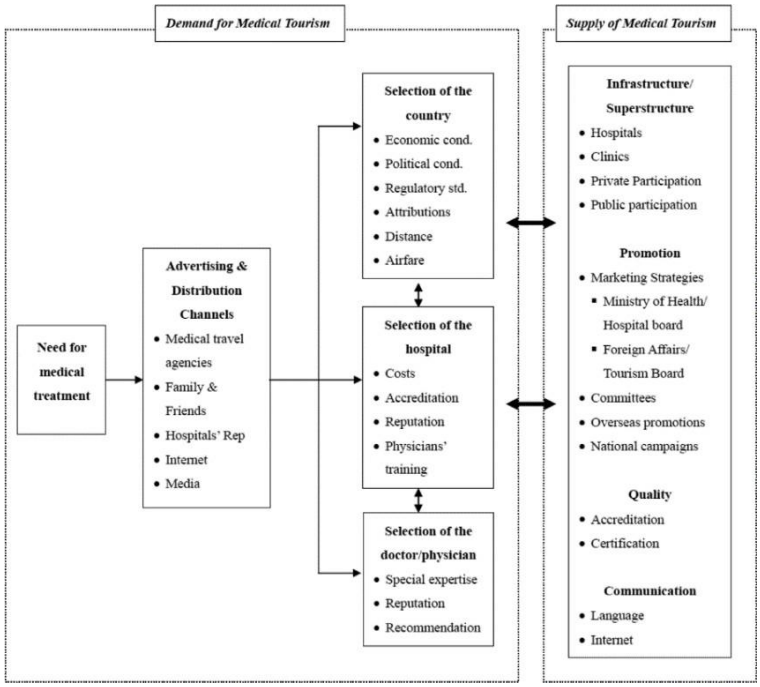

Figure 4: Supply and Demand Model of Medical Tourism (Heung et al., 2010)

Factors Affecting the Choice of Medical Facility and Destination

Smith and Forgione (2007) developed a model for medical tourism based on geographical segments and destination attributes (e.g. economic conditions, political climate etc.) that affect the tourist's choice of medical facility and destination (see *figure 5*). The arrangement of variables in the model suggests that no singular factor had a dominant effect on the customer's decision-making process; rather, both the factors affecting choice of destination and medical facility played an equal role (Oberoi and Kansra, 2019). Hueng et al. (2010) find that while the factors identified within the model do play a role in the destination decision-making process, they do not reflect a sufficient number of variables alone to determine the destination. Capar and Aslan (2020) find that safety and security, hygiene level and accessibility also play a role in the destination decision-making process, therefore highlighting a limitation in Smith and Forgione's (2007) model.

The order of factors also suggest that the choice of destination precedes the choice of medical facility (Oberoi and Kansra, 2019). Kim's (2017) findings align with Smith and Forgione's model (2007) – the author finds that medical tourists typically select the destination first before considering the facilities and services offered. It is important to note, however, that Hueng et al. (2010) argue that in some cases, the choice of medical facility may precede the destination if, for instance, the patient requires a type of treatment only offered at selected facilities.

Smith and Forgione's (2007) model also assumes that the decision-making process occurs in two phases – destination decision and medical facility decision. Hueng et al. (2010) criticise this by stating that there are usually more than two phases in the decision-making process, such as the BDDE factors and cognitive needs stage. Therefore, the model does not provide a comprehensive overview of the stages and motivations affecting the decision-making process.

Conceptual Model of Medical Tourism

Oberoi and Kansra's (2019) drew on key literature including Smith and Forgione's (2007) model and Heung et al.'s (2010) Demand and Supply framework. Considering the limitations discussed in the previous sections, the similarity in Oberoi and Kansra's (2019) model (*figure 6*) to Heung et al.'s (2010) framework warrants similar points of criticism. The "individual-related factors" in Oberoi and Kansra's (2019) model closely mirror Heung et al.'s (2010) "demand side", with the exception of the "advertising and distribution channels" in the former's model. Horsfall et al. (2013) find that to engage in the proceeding stage of informing one's decisions on the destination, hospital, and doctor, distribution channels play an integral mediating role between the two stages. Oberoi and Kansra's (2019) model fails to account for this transition, highlighting a limitation. This gap is reiterated in the "provider related factors" section,

as the authors do not consider the promotional channels from the medical facility and destination's side, as in Heung et al.'s (2010) model.

DISCUSSION

Proposed Conceptual Model for Motivational Factors in the Decision-Making Process – The CAS Model

As noted earlier, the current body of literature on medical tourism does not depict a comprehensive overview of the factors motivating medical tourism from the initial cognitive stages until the supply stage. Therefore, this paper aims to fill that gap by building on the theories and models discussed above, which formed the baseline to conceptualise the proposed framework, shown in *figure 7*. The factors considered under each stage can be generalised to different types of medical tourists and treatments, therefore widening the scope and applicability of the CAS (cognitive, awareness, supply) model. The CAS model comprises three key stages – cognitive intention stage, awareness and selection stage and supply

stage – to provide a comprehensive overview of the motivational factors that influence a medical tourist's decision-making process.

The terms "cognitive intention" in the first stage refer to the catalyst in the medical tourist's decision-making process as it is the initial detection of a need to seek medical treatment. Given that a medical tourist's primary reason for travel is to seek medical attention, the process followed in the model's first "cognitive intention stage" suggests the factors that would play a role in the medical tourist's intention formation to validate their behaviour of pursuing medical tourism. Therefore, the tourist is likely to undergo the first stage of the model to establish a need for medical tourism.

In the following stages, Heung et al.'s (2010) Demand and Supply framework was adapted as a blueprint for the second and third stage of the proposed decision-making process. As this was found to be the model with the least limitations, the new model proposed builds on the Demand and Supply framework to alleviate the limitations discussed, whilst integrating key theories discussed such as the TPB and PMT.

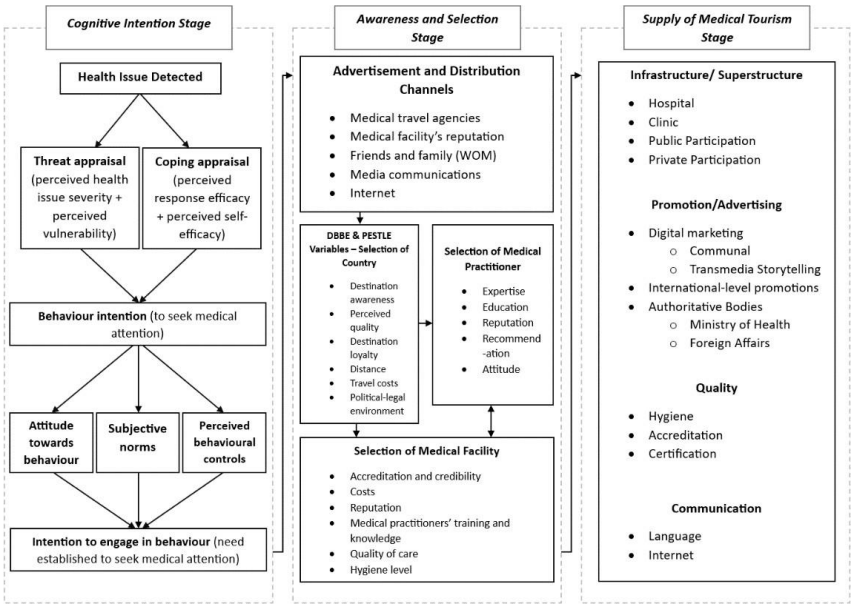

Figure 7: Proposed CAS Model for Motivational Factors in Medical Tourism Decision-Making

Cognitive Intention Stage

The first stage in factors motivating a tourist's decision-making process is proposed to be the cognitive intention stage. To initiate the decision-making process, a demand or need must be detected (Hueng et al., 2010). D'Ambrosia (2009) finds that due to internet accessibility nowadays, it is common for patients to self-diagnose and detect a health issue before formally consulting with a physician. Therefore, by identifying an irregular feeling and reaching the conclusion of needing to seek medical attention, the patient starts their cognitive decision-making process to assess their motivations in pursuing medical tourism depending on the following factors.

This is followed by the elements of the PMT, where the customer performs either a threat or coping appraisal to determine their behavioural intention. According to the PMT, either result will lead to the behaviour intention stage – namely the need to seek medical attention based on, for example, the threat's severity. For instance, if a patient detects a breast lump, the cognitive process of perceiving a threat with high severity (i.e. possibility of cancer) would result in the behaviour intention stage of seeking medical attention from a reputable facility (Shamsi et al., 2020).

Once the patient is motivated to seek "protection" (i.e. medical attention), the three motivational factors from the TPB come into play. Here, the patient would perform the positive or negative assessment of their behaviour to engage in medical tourism, consider the social pressure exerted to engage in the behaviour, and their own subjective perception of the ease or difficulty to engage in the behaviour, based on previous experience and expected obstacles (Boguszewicz-Kreft et al., 2020). By completing the cognitive assessment and "planning" the implications, the patient concludes the first stage of the motivational decision-making process in pursuing medical tourism.

Awareness and Selection Stage

As discussed, the second and third stages of the CAS model build on Heung et al.'s (2010) Demand and Supply framework. Therefore, the next stage of the model – awareness and selection – includes factors that would motivate the decision of a tourist to select a certain destination, medical facility, and doctor, based on awareness and distribution channels. The first segment represents the first chronological motivational variable, as this is how the customer is made aware of the destination, medical facilities and doctors. Lee and Fernando (2015) find that travel agencies, word-of-mouth (WOM) recommendations from friends and family, and the internet are key players in the distribution channels for medical tourism awareness. They hold that by gaining access to one or more of the channels, an individual's motivation, level of trust, and commitment to engage in medical tourism materializes (ibid, 2015), leading to the selection stage in the CAS model.

It is firstly important to note that the order of selection of the upcoming factors may occur more commonly in a certain pattern (i.e. selection of destination followed by selection of the medical facility) according to Smith and Forgione's (2007) model and Kim's (2017) findings. Therefore, the arrow originating from the awareness and distribution channels box feeds directly into the next stage – selection of destination based on DBBE and PESTLE variables. Section 2.1 discussed the importance of DBBE variables motivating the decision-making process. Aprinta et al. (2017) found that the selection of country based on the destination's DBBE variables is heavily influenced by the customer's response to the brand's marketing activities, therefore reinforcing the CAS model's order of decision-making. Most imperatively, however, recall that the data collected in *table 1* suggested that perceived and overall quality (of the service and facility) was a common denominator as a motivation for selecting the destination. Therefore, by capitalising on this, destinations can establish a competitive advantage by meeting tourists' quality expectations and fostering long-term relationships.

Additionally, the PESTLE variables – namely political, economic, social, technological, legal and environmental – in the destination's macroenvironment also play a role in the decision-making process. All models discussed in the literature review acknowledged the contribution of the PESTLE factors, such as destination attributes and WOM (Ye et al., 2011), economic, political and regulatory conditions and distance (Heung et al., 2010; Smith and Forgione, 2007), and cost (Oberoi and Kansra, 2019). Therefore, a combination of both DBBE and PESTLE variables constitute the factors motivating the destination choice.

Once a destination has been selected, the order of selecting a medical facility and practitioner is interchangeable according to the patient's needs (Hueng et al., 2010). Quality, again, plays a central role in determining the medical facility, along with other variables such as reputation, hygiene level, and treatment costs (Smith and Forgione, 2007). As for the medical practitioner, medical tourists have typically reported to consider expertise, education, and attitude amongst other variables. Attitude, an intangible factor, plays a particularly crucial role in the customer's experience, as it affects the trust between a patient and doctor (Yang et al., 2019). Hasan et al. (2019) find that attitudes can affect

the tourist's revisit intentions, therefore, a brand's DBBE dimensions given the "brand resonance" block in Aaker's (1991) CBBE model. Hence, to establish loyal relationships with the customer, medical tourism destinations and facilities can leverage the attitude element to create positive, long-term relationships (Rahman et al., 2022).

Supply of Medical Tourism Stage

The final stage affecting a medical tourist's decision-making process is the supply of medical tourism. This reflects the as-is situation of medical tourism in relation to the physical infrastructure, promotional and advertising activities, quality, and communication mediums from the medical supplier's end. This stage in the process is important to consider as it bridges the interaction between the medical tourists' needs and how they interact with the services and products supplied by public bodies in the context of medical tourism (Heung et al., 2010). By doing so, gaps in the supply of medical tourism can be identified to better tailor the providers' services and products to the needs of medical tourists.

Several countries developed their reputation as a medical tourism destination by promoting their products and services in the medical tourism sector (Heung et al., 2010). For example, Thailand's effective marketing strategies and cooperation with the public and tourism centers to provide world-class hospitality service and quality made the destination a benchmark for medical tourism strategy.

As discussed in the awareness and selection stage, quality is the cornerstone of motivation in medical tourism. Again, in the final stage, quality impacts customers' decisions when deciding factors on the supply side, making it imperative for medical facilities to prioritise. Hussein et al. (2021) found that facilities holding accreditations such as the JCIA had a positive effect on process-related performance measures, patients' stay duration, and efficiency. Therefore, promotional and advertising techniques, along with quality, play a crucial role in the final motivational factors that affect the decision-making process.

THEORETICAL AND MANAGERIAL IMPLICATIONS

By integrating medical tourism theories and existing models, this paper proposed a new holistic model – the CAS model – to determine the motivational factors that play a role in the decision-making process of a medical tourist. Through identifying and establishing the primary role of the initial cognitive intention stage, an emphasis has been placed on the pivotal role that an individual's needs play when deciding to go through the medical tourism process.

Therefore, a key implication of this study is that it poses a new challenge for marketers – namely to comprehend the subjective needs of medical tourists more accurately, and then translate them into effective marketing strategies (Garg et al., 2023). Additionally, the recurrent emphasis on quality creates an opportunity for medical tourism destinations, and for those striving to boost their medical tourism, to introduce durable policies and regulatory initiatives to capitalise on this crucial factor, as demonstrated through Thailand's case.

Two limitations arise within this study due to its research design. The first is that the analysis synthesised other authors' interpretations of data, rather than the primary data, therefore risking dilution and influencing this paper's findings (Leamy et al., 2018). Secondly, a wider range of data could have been used to further explore the existing models within medical tourism literature.

RECOMMENDATIONS FOR FUTURE RESEARCH

Given the development of the CAS model being based on previous theories and models, future studies can benefit from using the CAS model in the following ways to better gauge its usability and generalisability:

A longitudinal study of a singular medical tourism destination would enable a deeper analysis of all three stages in the CAS model over a certain period (Heung et al., 2010).

A quantitative study can be carried out to determine whether there is an equal motivational distribution of the various factors within all three stages of the model (ibid, 2010).

The order of selection factors in the second stage (awareness and selection) of the CAS model can be verified as being subjective and further analysed through qualitative methods.

A cross-culture study can be carried out to compare how similar or different the factors affecting different nationalities' decision-making processes are at each stage in the model (Ayyildiz and Koc, 2023).

CONCLUSION

This paper developed a holistic conceptual model for the motivations behind medical tourists' decision-making process. It began with a literature review which laid the cognitive foundation in the decision-making process. Then, models such as the Demand and Supply (Hueng et al., 2010) framework and Factors Affecting the Choice of Medical Facility and Destination Model (Smith and Forgione, 2007) were analysed by discussing the gaps and limitations of each. Building on the gaps, this paper proposed the CAS model to better understand motivations in the medical tourism decision-making process, which comprised of three stages: cognitive intention stage, awareness and selection stage, and the supply stage. A discussion of each stage followed, which gave rise to implications and recommendations for future research, such as carrying out qualitative and cross-culture studies to gauge the model's usability.

AN APPRAISAL OF CLIMATE CHANGE RELATED POLICIES AND STRATEGIES: ADAPTATION AND MITIGATION OF THE HOTEL INDUSTRY IN MAURITIUS

Pariag-Maraye, N

neevemaraye@gmail.com

University of Mauritius

Appadoo, K.A

University of Mauritius

ABSTRACT

Small Island Developing States(SIDs), with their unique characteristics and economic, environmental and socio-cultural contexts face heightened climate change risks, impacting their hotel industries. Recently, Mauritius has experienced extreme climatic conditions, inducing hotels to adopt measures to address climate change. This study aims to investigate the climate mitigation and adaptation strategies that hotels in Mauritius have adopted to address these risks and to explore the internal and external barriers impeding the implementation of such initiatives. A multiple regression analysis was conducted to gauge the relationship between these barriers and the implementation of such measures in the hotel industry. Recommendations are provided to help hoteliers in climate strategy implementation.

Key words: *climate change, adaptation and mitigation, tourism industry, Mauritius*

1. Introduction

Small islands Developing States (SIDSs) are highly exposed to changing climatic conditions which severely impact business operations(Hess & Kelman, 2016). For instance, Mauritius is ranked 51st worldwide for greatest disaster risk according to the World Risk Report 2021 (Doorga, 2022). Despite the fact that the emission level of the country might be relatively insignificant, the island is subject to inevitable circumstances such as sea level rise, accelerated beach erosion which may lead to the island to shrink overtime, degradation of coral reefs and loss of cultural heritage and flooding (Hassen & Surroop, 2021) which are likely to impair its status as a tourist attraction. Since climate change directly impacts the hospitality industry, it is imperative for hoteliers to maintain sustainability to retain tourists (Abdou et al., 2020) by adopting measures to address climate change. In the same vein, a panoply of frameworks have been put forward to encourage the adoption of climate change related policies both internationally and nationally. However, a lack of binding regulations and environmental laws governing the impact of climate change in Mauritius (Mahadew and Appadoo, 2018), result in hotels being less willing to implement climate change related policies and strategies. Moreover, hoteliers face challenges while implementing sustainable initiatives in the hotel industry (Hillary,

2004). Hence, the question arises as to the extent to which hotels in Mauritius are aware and prepared to address climate change related-risks, which mitigation and adaptation strategies hoteliers have implemented, and the barriers they encounter in addressing climate change. Using the backdrop of international and regional/national frameworks on climate change, this study investigates the current climate change related mitigation and adaptation strategies and policies adopted by the hotel industry in Mauritius and also the challenges that the hoteliers face in the implementation of those policies and strategies.

2. Literature review

Anthropogenic climate change involves the rise of green-house gas emission which eventually causes climate variability. It has been defined by the United Framework Convention on Climate Change as "a change of climate attributed directly or indirectly to human activity altering the composition of the global atmosphere" (Simon-Lewis, 2017). In this relation, international frameworks have been enacted to guide organisations towards effective implementation of green energy to address climate change, as discussed below.

The United Nations Framework Convention on Climate Change (UNFCCC), whose aim is to prevent dangerous human interference with the climate, was adopted in 1992 and entered into force on 21st March 1994. 198 countries have ratified the Convention, including the Republic of Mauritius, which ratified the Convention on 4 September 1992. The ultimate objective of the Convention is to stabilise greenhouse gas concentrations (GHG). The total GHG emissions in Mauritius in 2022 were 5, 642.2 Gg carbon dioxide equivalent compared to 5, 471.8, an increase of 3.1 %. Mauritius accounts for only 0.01 % of GHG emissions; nonetheless it is among the most at risk to climate change (African Development Bank Group, 2023).

The Paris Agreement (PA) was adopted in 2015 and entered into force on 4th November 2016. The PA has a holistic goal of holding "the increase in the global average temperature to well below 2^0 C above pre-industrial levels" and make efforts "to limit the temperature increase to 1.5^0C above pre-industrial levels." The Republic of Mauritius ratified the PA on 22 April 2016. There is a high level of implications for the tourism industry with the coming into force of the PA (Scott et al., 2016). If left unfettered, tourism would consume the whole carbon budget compatible with the 2^0C target by 2050 (Scott et al., 2016). As Mauritius is a dualist country, Mauritius has had to adopt a specific statute so as to crystallise the PA into its national legislation. Therefore in 2021, the Climate Change Act was adopted. Among the relevant measures under the Climate Change Act, is the establishment of an inter-ministerial Council tasked with fashioning climate change policies in several sectors, including tourism (Climate Change Act, 2021).

The World Tourism Organisation (UNWTO) is the United Nations agency responsible for the promotion of responsible, sustainable and universally accessible tourism. It can be assumed that combating climate change is within the agenda of the UNWTO as one of its priorities is "supporting sustainable tourism policies and practices", including environmental sustainability. The UNWTO identifies some categories of climate change impacts that could have an influence on tourism destinations, their competitiveness and sustainability. These include direct climatic impacts, indirect environmental change impacts and impacts on mitigation policies (UNWTO and UNEP, 2008). Regarding

mitigation, the UNWTO and UNEP identify 4 major strategies towards limiting GHG related to tourism activities. They are reducing energy use; improving energy efficiency; increasing the use of renewable energy and sequestering carbon through sinks (UNWTO and UNEP, 2008).

The World Travel and Tourism Council (WTTC) is the global authority on the economic and social contribution of travel and tourism. One of the aims of the WTTC is to promote sustainable growth. Despite establishing aspirational emission reduction targets since 2009, the WTTC "acknowledges that travel and tourism has likely increased emissions" (WTTC, 2015, p. 14). Estimates from Gossling and Peeters (2015) indicate that the increase would be approximately 35 %.

Africa is among the highly susceptible continents to climate change and it is necessary for Africa to build a green economy (World Economic Forum; 2002). The African Union Strategy on Climate Change has the following aims, which are to strengthen the environmental integrity of biological processes and ensure the sustained existence of natural assets; attain SDG 13 through "harmonised adaptation and mitigation responses to climate change in Africa (African Union, 2014, p. 8) for the years 2020-2030 and provide a framework for guiding stakeholders in addressing climate change challenges, with the ultimate goal of improving the well-being of African people and the ecosystems they inhabit.

As a member of the African Union (AU), Mauritius is bound by the above objective. Africa's abilities to adapt and mitigate against climate change hinges on its capacity to acquire renewable technologies. Africa's priorities in adaptation are focused on achieving sustainable development, reducing poverty and achieving the Millennium Development Goals. Furthermore, as a party to the African Union, Mauritius has the duty to implement the AU's Climate Change and Resilient Development Strategy and Action Plan 2022-2023 which borrows from the AU's Green Recovery Plan 2021, which has as focus nature-based solutions, including ecotourism. There is no doubt that Mauritius's hotels should consider ecotourism as an opportunity for both climate adaptation and mitigation.

Also**,** Mauritius joined the Southern African Development Community (SADC) in 1995. One of the objectives of the SADC is to achieve sustainable utilisation of natural resources and effective protection of the environment. The policy paper considers the climate change impacts on several sectors, including tourism. It also covers GHG mitigation (SADC, 2008). SADC aims to develop a climate change and development agenda, which includes an approach that will be centred on the vision and core values of SADC, as well as the participation and accountability of al

The Carbon Disclosure Project (CDP) is among a company's voluntary ecological disclosure channels that allow for the examination of disclosure decisions. The CDP forwards questionnaires to companies around the world to collect data on GHG emanations and interlinked problems such as emission reduction schemes and endeavours. Managers are faced with two sequential decisions. Initially, they have to decide whether to collect the data requested, fill in the questionnaire, and send it back to the CDP. Second, they have to choose if their response will be made publicly available or not.The CDP questionnaire is chiefly suited for a cross-country study as it allows for an internationally reliable disclosure standard. Besides, GHG emanations have a widely alike impact almost anywhere in the globe and

therefore allow the use of similar accounting mechanisms. The main indicator of the framework is gross absolute greenhouse gas emissions.

2.2 Climate Change and local regulations - Hotel industry in Mauritius

As per the climate change report (2024) of the Meteorological station of Mauritius, the impact of greenhouse gases emission on our natural and ecological systems are inevitable and evident. Mauritius is thus extremely vulnerable to the menace of climate change, manifesting itself in the forms of cyclones, tidal surges, droughts and flash floods and creating a less attractive image of the destination. Since the tourism sector forms the third pillar of the Mauritian economy (African Leadership, 2023), it is imperative for the legislature and executive branch of the State to enact laws and regulations to implement measures to combat climate change. These are discussed below.

The ***Environment Protection Act (EPA)*** was established in 2002 and it aims to ensure environmental protection and management of environmental assets in Mauritius. It is based on the Precautionary Principle, Principle of Prevention and Polluter Pays Principle. Precautionary Principle refers to safety environmental measures taken to diminish environmental threat (US Legal 20160. Section 2 of the EPA provides that each citizen in Mauritius should preserve and improve the quality of environment (EPA 2002). Principle of Prevention involves standards set to limit negative consequences caused and ensure sustainable environment, while Pollute Pays refers to compensating for damage done to environment to both victims and environment by paying cost of degradation.

The ***Energy Efficiency Act (EEA)*** was established in 2011 and under Section 5, it aims to encourage efficient use of energy and also enhance awareness about the benefits of reducing carbon emission and encourage resilience to environment (EEA; 2011). Moreover, the EEA designed strategies for efficient use of energy, developed consumption standards, and provided guidelines and recommendations of best energy efficiency techniques across all sectors. Negative sanctions will be given if; people do not conform to minimum energy standards (Section 2 EEA).

The Mauritian Renewable Energy Agency Act (MREAA) emerged in 2015 and encourages use of renewable energy sources in organisations and encourages sustainable culture (Section 4 MREAA). Moreover, use of renewable energy sources lower greenhouse emission and is an effective measure to mitigate climate change, therefore should be encouraged to be implemented in businesses, for example the MREEA provides subsidies to businesses to afford solar heaters (Wentist 2018).

The updated National Climate Change Adaptation Policy 2021 guides Mauritius's actions on adaptation and includes tourism as a key area for implementation of nature-based solutions for adaptation through the proposal of a new policy orientation in an effort to build resilience. Under the African Adaptation Programme, this framework has been devised to ensure sustainable implementation of strategies regarding climate change mitigation (Ministry of Environment 2018). The framework aims to integrate sustainable daily practices in businesses (Page 23).

2.3 Climate Change Related Adaptation and Mitigation Strategies

As discussed, tourism is at risk mostly because the industry's infrastructure is frequently concentrated along the coastline and its operations profoundly rely on ecological qualities such as the quality of sand beaches and reefs. Hence, necessitating sustainable development within the hotel industry. Green implementation within the hotel industry may reduce operation costs by up to 30% (Houtte, 2023) and enhance competitive advantage which result in improvement of hotel image and employee morale (El Seteha et al., 2023). The report of IPCC (2018) suggests that adaptation and mitigation are two complementary ways to address climate change. Therefore, mitigation strategy is required to avoid causes of climate change, while adaptation helps to reduce costs of climate change impacts. The application of these strategies will be discussed below.

The IPCC (2018) defines mitigation strategies as efforts to decrease greenhouse emissions, thereby restricting the extent of global warming our planet will undergo. The UNWTO-UNEP (2008) stated that energy efficient equipment, renewable energy, recycling and carbon offsetting are considered as best mitigation measures. The following mitigation strategies from different literature reviews have been described below:

The hotel industry consumes a high amount of energy which contributes to climate change. Therefore, to avoid energy wastage, hotels have implemented energy efficient equipment to enhance sustainability and mitigate climate change. Energy efficient measures involve implementing effective lighting measures, maximising natural ventilation and designs of thermal insulation to reduce the carbon footprint (Wu et al., 2022). In fact, the maintenance structure of a hotel building holds significant potential for energy conservation, with doors and windows accounting for roughly 50% of the building's total energy use. Since it is not feasible to replace existing maintenance structures, enhancing the thermal design of buildings could substantially decrease energy consumption. For instance, reflective glass and double glass can be employed to enhance thermal insulation properties of glass and lessen the cooling demand resulting from external windows (Wu et al., 2022).

As per the IPCC (2018), climate change adaptation policies refer to actions aimed at assisting individuals in adjusting to both present and future effects of climate change. These involve advanced technology, managerial action and education which influence behaviour of stakeholders and reduce greenhouse emission, as will be discussed below.

- *Retrofitting Hotel Design*

A common adaptation strategy is the retrofitting of hotel designs. Retrofitted hotels have double glazed windows, ensuring natural ventilation and daylight enhancing more resilience to climate change, as well as reducing greenhouse gas emission (Rogerson and Sims, 2012). In addition, Cabeza, Matorell, Coma & Perez (2014) stated that retrofitted hotels integrate energy efficient resources, design practices, construction and operations to ensure significant resource efficiency.

- *Environmental Management System*

According to Kucerova (2012), the Environmental Management System (EMS) refers to a tool to identify issues, monitor and improve environmental performance. EMS involves a continuous process of energy efficiency,

purchasing of eco-friendly goods, recycling schemes, sustainable technology and environmental education (Pizam, 2009). EMS involves ISO 14000 which are highly implemented by hotels for increase in productivity, efficiency and profitability. For instance, the Intercontinental hotel in London implements EMS and saves energy by 34%.

- *Staff Training*

Staff training and education in sustainable management and operations increases awareness and plays a pivotal role in adopting decarbonization initiatives to address climate change impacts (Gossling & Lund-Durlacher, 2021). Bohdanowicz et al (2005) argued that a climate change training program should be provided to employees to enhance understanding about the climate change phenomenon, its impacts and strategies to reduce both causes and vulnerabilities. The ISO4001 EMS encourages training sessions alongside a training manual to enlighten staff regarding climate change initiatives and procedures. The Accor Group of Hotels is a pertinent example of training employees towards adopting measures. It has launched a "School for Change" training program with the aim to enhance employees' knowledge on the causes of climate change and its effects on biodiversity and communities (Mahiette, 2022).

- *Climate change Education for Guests*

Environmental education of guests is crucial for successful implementation of environmental initiatives in the hotel industry as it enhances better understanding of guests and ensures sustainability (Stapp, 1969). It has been found by (Shang et al, 2010) that hotels which provided sustainable education to guests were more likely to have successful sustainable implementation and also 84% of guests of its sample study adopted environmental initiatives, such as towel reuse, turning off TV and lights when not in hotel room and engaged in other environmental activities. For instance, the 5 Star Orchid Hotels in Mumbai inform guests of environmental activities and engage in growing trees. This chain of hotels in Mumbai annually organises mangrove plantation day and encourages guests to plant trees.

- *Implementing a Culture of sustainability*

Moreover, a culture of sustainability in the hotel industry encourages innovative ideas and brings staff together to design solutions and implement green initiatives. Chan & Wong (2006) reported that the hotel industry needs to inculcate a sustainable culture to implement climate change related mitigation and adaptation strategies. Accordingly, a sustainable culture will enhance environmental awareness, provide training and education to both employees and guests and also motivate employees through monetary and non-monetary rewards to encourage environmental innovation. It also enforces commitment and environmental values, as well as ensures coordination of both staff and customers who will play a significant role in the successful implementation of EMS. For instance, the Sunlife resorts have implemented a culture of sustainability which imbibes gender equality, achieving water efficiency, reducing waste, preserving biodiversity and reducing carbon emission.

Barriers to Implementing Climate Change Mitigation and Adaptation Strategies in the Hotel Industry

Sustainable practice barriers refer to obstacles that the hotel industry faces with respect to the implementation of climate change related mitigation and adaptation policies. These can be categorised into internal and external barriers (Chan, 2008).

Internal Barriers

Internal barriers are the major controllable issues within a business environment that the hotel industry face during implementation of climatic change related policies and strategies. For instance, lack of knowledge, untrained employees, lack of technology, lack of finance, demotivated employees among other barriers (Ajay et al., 2019). It has further been reported by (Hillary, 2004) that internal export barriers decrease hotel industry environmental performance.

Knowledge Barrier

Knowledge barrier involves lack of information and inadequate knowledge. As per Levy and Dilwali (2000), lack of knowledge is a major barrier which hinders effective implementation of climate change related policies and strategies in the hotel industry. Most managers in the hotel industry lack knowledge and technical knowhow on energy saving technologies and environmental procedures (Thollander & Johansson, 2017), leading to managers being inhibited from acknowledging the numerous benefits from energy efficient practices (Lawrence et al., 2020), and hence hotels experiencing difficulties in effectively implementing climate change related policies and strategies (Fraj et al., 2014). Based on the aforementioned. the following hypotheses have been developed:

H0a: There is no relationship between knowledge barrier and implementation of climate change related policies and strategies in the hotel industry.

H1a: There is a negative relationship between knowledge barrier and implementation of climate change related policies and strategies in the hotel industry.

Resource Barrier

Furthermore, according to Fukey & Issac (2014) stated that lack of resources and expertise represent an important obstacle to the implementation of climate change related policies and strategies. Resource barriers involve a lack of staff training and expertise, inadequate technology and negative management attitude (Brammer et al., 2012). In fact, it has been reported by Mbasera (2017) from studying 2 hotels in South Africa and Zimbabwe that hotels which lack technology and staff training to implement green initiatives, do not prioritise environment management in the hotel industry. Moreover, Kasim (2008) stated that insufficient physical infrastructure demotivates employees to implement

green initiatives. For instance, in Penang Hotels, employees are less motivated to implement climate change related policies and strategies due to lack of advanced technology. Therefore, the resulting hypotheses is as follows:

H0b: There is no association between resource barrier and implementation of climate change related policies and strategies in the hotel industry.

H1b: There is a negative relationship between resource barrier and implementation of climate change related policies and strategies in the hotel industry.

Financial Barrier

Another major barrier is the cost of implementing climate change related policies and strategies (Chan, 2008). As per Graci (2008), enhancing sustainable practices in the hotel industry comes with a financial crunch since infrastructure cost increases by 10%-15% in green building. For instance, Carlson (2012) posits that the implementation of retrofitted buildings requires advanced technology which is highly expensive. Since energy efficient equipment costs highly, hotels that do not have adequate capital will be unable to implement the sustainable culture. Therefore, this leads to deducing the following hypotheses:

H0c: Financial Barrier does not influence implementation of climate change related policies and strategies in the hotel industry.

H1c: Financial barrier negatively influences implementation of climate change related policies and strategies in the hotel industry.

External Barriers

External barriers, on the other hand, are uncontrollable and risky obstacles impacting on the implementation of climate change related policies and strategies, and which occur outside the business environment (Chan, 2008). The external barriers to sustainable practices in the hotel Industry involve governmental barriers, competition barriers and behavioural barriers.

Governmental Barrier

As per Michailidou et al (2015), a lack of government regulations enforcing the implementation of climate change related policies and strategies is a key barrier to the hotel industry. Masood, Fayed et al (2010) argue that the lack of government support and proper legislations regarding measures to address climate change in developing countries induce the reluctance of hotels in implementing such initiatives. For instance, in Lebanon, a lack of legislation and security discourages hotels from adopting green initiatives. In addition to lack of government support, Rogerson and Sims (2012) argued that there is a lack of environmental laws which therefore, do not force hotels to instil a "Go-Green" culture and they highlighted that the national government is only weakly promoting sustainability within this

sector, which is why South African hotels lack behind green initiatives. In this relation, the following hypotheses can be inferred:

H0d: Governmental Barrier does not impact on the implementation of climate change related policies and strategies

H1d: Governmental barriers negatively impact the implementation of climate change related policies and strategies

Behavioural Barriers (Market demand and consumer attitudes)

Customer cooperation and coordination is crucial for the implementation of climate change related policies and strategies in the hotel industry (Schmidheiny, 1992). It has been found by (Kasim & Ismail, 2011) that despite high tourist concerns on the environment, they do not choose green hotels deliberately due to high costs. In fact, Barsky (2008) demonstrated that green practices in luxury hotels are perceived as low standards by customers. Tourists perceive recycled papers and food as low quality and low standards in luxurious hotels (Gretz and Carlsen, 2006). They are hesitant towards towel reusing program (Bohdanowiz et al., 2016) as they want fresh towels and clean sheets every day (Kirk & Lynch 2008). Likewise, customers decline reusing bed sheets and soap dispensers in amenity bottles and refuse to accept decrease in amenities or pay premium for green practices (Manaktola, 2007). In addition to customer attitudes, Luthra et al (2011) found that customer ignorance is a major challenge hotel managers face while implementing sustainable activities. Customer ignorance is defined as customers neglecting the importance of sustainable lifestyle and neglecting benefits of green services. For example, the Mozambican hotels are unable to implement environmental initiatives as the local customers lack awareness and are more concerned on cost rather than impact on environment (Brik et al. 2013).

Therefore, consumer behaviour and attitudes negatively influence the implementation of climate change related policies and strategies in the hotel industry, as deduced in the below hypotheses:

H0e: There is no relationship between behavioural barriers and implementation of climate change related policies and strategies in the hotel industry.

H1e: There is a negative relationship between consumer attitudes and implementation of climate change related policies and strategies in the hotel industry.

Competition and Other External Factors

Since there is a high need for the implementation of climate-change related policies and strategies in the hotel industry, there will be intensive competition to create competitive advantage. However, some small hotels may be vulnerable to competition barriers due to financial constraints, lack of resources and lack of knowledge. Unctad (2015) stated that small hotels suffer from superior bargaining power of large hotels. Thus, fierce competition from large hotels will

negatively impact environmental implementation in hotels and it can be supported by Hillary (2000) who found that intensified competition led to a barrier in implementation of sustainable practices in Ghanaian hotels, thus decreased its chance of demarcating from competitors and creating a competitive edge and led to losses.

Another challenge Hotel managers face is weather uncertainty. Platten et al. (2011) stated that unpredictable weather conditions lead to inability to run energy efficient equipment effectively. For example, due to storms and rain solar panels cannot generate electricity in Hong Kong hotels.

In relation to the above, the following hypotheses have thus been formulated:

H0f: There is no relationship between competition barrier and implementation of climate-change related mitigation and adaptation measures in the hotel industry.

H1f: There is an adverse relationship between competition barrier and implementation of climate-change related mitigation and adaptation measures in the hotel industry.

Cultural Barriers

Cultural barriers refer to obstacles related to corporate beliefs and values which hinder implementation of climate-change related policies and strategies in the hotel industry. According to OECD (2006), cultural barriers may impact negatively on both employee and customer attitudes. For instance, Segovia and Galang (2002) reported that hotels in Ghana tend to imbibe a culture of cost reduction rather than sustainable practices. This may cause demotivation of employees due to lack of understanding and lead to high labour turnover resulting in high cost. It may also result in the disappointment of customers, leading to low sales and business failure. In fact, Williams & Dair (2013) stated that cultural barriers were cited as significant barriers by 84% of respondents in research and had to be overcome by effective communication by top management.

Therefore, to decipher whether cultural barriers act as an impediment to sustainable initiatives in the hotel industry, the following hypotheses have been formulated:

H0g: Cultural barrier does not impact on the implementation of climate change related policies and strategies in the hotel industry

H1g: There is a negative relationship between cultural barriers and the implementation of climate change related policies and strategies in the hotel industry.

3. METHODOLOGY

For the present study, a survey was carried out, whereby simple random sampling is used to ensure accurate and representative outcome, reducing sampling bias. The sample has equally considered hotels from the Northern,

Southern, Eastern and Western part of the island. Ethical guidelines were highly prioritised, such that all information provided are highly confidential, anonymous and are used for academic purposes only. A questionnaire was used as a research instrument to ensure that valid and reliable data are gathered in a cost- effective way (Kabir, 2016). The questionnaire includes both closed and open-ended questions. Open-ended questions allow respondents to share information based on their personal understanding and explanation (Sabo, 2019), thus rising level of validity, while closed-ended questions involve the use of specific questions (Roopa & Rani, 2012) which leads to uniform answers given by different respondents (Taylor-Powell, 1998), thus facilitating comparisons of data. This information has been converted into quantitative data that are coherent and consistent for analysis (Oben, 2021). 35 items of scale have been subjected to Cronbach's Alpha reliability to evaluate the degree of correlation among responses to survey questions (Jugessur, 2022). According to Osotimehin et al (2012), scales of measurement reaping a result of more than 0.7 are considered as reliable. The Cronbach ‘s Alpha test has been used to ensure the Likert scale questions are reliable and is based on the ten responses obtained in the pilot test. Table 2, 3,4,5,6 demonstrate that the Likert-scale questions are reliable and consistent due to the results above 0.7. In addition, the regression analysis was used to analyse the relationship between the implementation of climate change policies and strategies, and barriers faced impeding these measures.

4. KEY FINDINGS

For the purpose of this study, questionnaires were sent to 90 hotels across this island, out of which only 48 responded. This reflects 53.3% of participation. The sample consisted of 60.4% 4-star hotel, 27.1% 3-star hotels and 4.2% 5-star hotel respondents. Tables 13, 14 and 15 show the different findings deduced from this study.

Table 1 shows the correlation coefficient (r), the coefficient of determination (R^2), the standard error and the F-change. With regards to the findings for internal barriers and external barriers impeding the implementation of strategies to address climate change, R^2=72.6%.

Hypothesis H1a addresses the correlation between knowledge barriers and the implementation of climate-change related policies and strategies in the hotel industry. From table 3, it can be deduced that there exists a negative and significant relationship between both factors ($r = -0.357$, $p=0.002<0.005$). H1a is thus accepted, as an increase of 1 unit in the knowledge barrier results in a decrease of 0.357 in implementation of climate change policies.

Likewise, H1b tests the correlation between resource barriers and implementation of strategies to address climate change in the hotel industry in Mauritius. As per the table 3, it is inferred that there is a negative relationship between resource barriers and implementation of climate change related policies and strategies ($r = -0.416$, $p=0.004<0.005$). Therefore, H1b is accepted as the result suggests that for every unit of change in resource barrier, there will be a decrease of 0.416 in implementing measures to address climate change in the hotel industry in Mauritius.

Similarly, H1g suggests the relation between cultural barriers and the implementation of climate change related policies in hotels. In this aspect, table 3 reveals a negative relationship between both factors ($r= -0.806$,

p=0.000<0.005). As a result, H1g is accepted, as an increase of 1 unit in culture barriers results in a decrease of 0.806 in the implementation of climate change related measures.

In addition, H1e addresses the correlation between behavioural barriers and hotels implementing measures which address climate change in Mauritius. The results in Table 3 reflect a negative relationship between behavioural barrier and green implementation (r= -0.249, p=0.003<0.005). Hence, H1e is accepted since an increase of 1 unit in negative consumer attitudes may result in a decrease of 0.249 of implementing climate change related policies and strategies in the hotel industry.

Furthermore, financial, governmental and competition barriers are considered insignificant as p>0.005. For instance, p=0.486>0.005 for financial barriers, p=0.603>0.005 for competition barriers and p= 0.718>0.005 for governmental barriers, indicating that data provide little and no evidence that the null hypothesis is not false. As a result, H0c, H0d and H0f are respectively accepted.

5. Hypotheses Summary and Discussion

One of the main aims of this study is to assess the challenges that hoteliers face in the implementation of the abovementioned climate change related mitigation and adaptation strategies and policies adopted by the hotel industry in Mauritius. It has been concluded that a rise in the knowledge barrier is likely to impact negatively on sustainable implementation in the hotel industry. This outcome is supported by Lawrence et al (2020) who stated that a lack of knowledge and information inhibits managers from implementing sustainable initiatives in the hotel industry in Ghana. Since managers in Mauritian hotels lack knowledge of the benefits of sustainable implementation, they are unable to prioritise the Go-Green culture. Moreover, it is revealed from the study that an increase in resource barriers will decrease green implementation in the hotel industry and this has been further highlighted by Hasan et al, 2019; Lawrence et al 2020) who argued that lack of technology and environmental expertise hinder successful green implementation in the hotel industry. In the local context of Mauritius also, hotels which do not focus on environmental employee training, sustainable implementation are less likely to be successful in inculcating a green culture. In addition, it is deduced that an increase in cultural barriers will decrease initiatives to implement climate change measures. This has been further supported by Foxwell-Norton et al. (2019) in a report, whereby it is posited that cultural barriers influence understanding and acceptance of the necessity to adjust and respond to climate change. It can also be noted that in Mauritius also some hotels mainly 3 stars and 4 stars focus on low cost and high profit culture which hinder their sustainability initiative. Moreover, the findings of the study indicate that there is a significant negative relationship between behavioural barriers and the implementation of climate-change related policies and strategies in the hotel industry. Tiwari et al., (2024) have highlighted that consumers' negative attitudes towards adopting eco-friendly measures, due to factors such as high costs, may lead to hotels hesitating to implement such initiatives. In the Mauritian hotel industry, Mauritians and most tourists are more likely to move towards luxurious hotels than green ones and it is unfortunate that Mauritians' trend does not involve sustainability.

However, the study also illustrates that there is no relationship between finance barriers and the implementation of climate-change related policies and strategies in the hotel industry in Mauritius. This has been contradicted by (Thollander & Johansson, 2017) that financial constraint hinders implementation of climate change mitigation and adaptation strategies. However, in the local context, financial facilities are provided by the Development Bank of Mauritius and other bank institutions which resolve the issue.

On the other hand, the study implies that there is no relationship between governmental barriers and the implementation of climate-change related policies and strategies in the hotel industry in Mauritius. However, the survey of Mota et al., (2024) contradicts this and indicates that a lack of incentives by the government may impede the adoption of climate change mechanisms. Accordingly, cooperation between entrepreneurs and the government amplifies Corporate Social Responsibility in hotels. In Mauritius, government barriers do not pose an issue as the Government along with the Ministry of Tourism and United Nations provide their support through designation of action plan for efficient accommodation and also encourage sustainable innovations in the hotel industry. The Government of Mauritius also enforced environmental agencies such as, Mauritian Renewable Energy Agency to support and encourage hotels and other institutions to implement renewable energy such as photovoltaic technology. Moreover, there has also been the emergence of National Climate Change Mitigation and Action Strategy (2018) and National Climate Change Adaptation Framework to provide an insight of climate change strategies and encourage implementation.

In addition, the study signifies that competition barrier is not related to the implementation of climate-change related policies and strategies in the hotel industry, thus competition does not influence green implementation in the hotel industry in Mauritius. However, Hillary (2000) found that intensified competition led to a barrier in implementation of sustainable practices among Ghanaian hotels. Therefore, this does not apply in the Mauritian context due to strong competition law and instead competition encourages Mauritian hotels to follow the path of sustainability and demarcate itself from competitors.

6. RECOMMENDATIONS

Capacity Building

In order to address the climate change related risks, hotels in Mauritius are encouraged to organise workshops, seminars and training programs to increase the awareness of their staff and educate them about the risks but also the possibilities and opportunities that climate change represents to the hospitality sector. Thus, the training program will enhance the managers' expertise about green initiatives and help to adopt technology with minimum effect on customers, eventually enhancing customer satisfaction and hotel's goodwill. Through both international and local training and development programs, employees will learn effective management of sophisticated technology and understand the benefits associated with green implementation. Employees can also receive an environmental manual to guide them in effective and successful green implementation.Environmental staff education will also avoid

resistance to change and enhance better understanding of sustainable implementation. Therefore, employees will be more likely to provide good customer service, ensuring customer loyalty, demarcating from competitors and increasing profitability.

Establish Green experts to incorporate sustainable ideas

The government along with the hotel group should provide hotels with green experts to suggest sustainable ideas to be incorporated in design and construction at different stages of a hotel. During both renovation and establishment of a new hotel, green experts will provide knowledge and help to allocate resources to implement in the hotel industry. Furthermore, technical teams can be established to avoid failure of environmental technology. This will assure both managers and employees that green implementation will be successful in the hotel industry. Establishing a green expert will alleviate pressure on managers and encourage more green initiatives in the hotel industry in Mauritius.

Inculcate a sustainable culture

The tourism industry authority should inculcate a standardised and sustainable culture, whereby green initiative is the norm and forms part of the corporate value. Furthermore, one of the respondents has proposed in an open-ended question that "hotels could be eco-friendly and use natural energy generating devices, and recycle the waste". The change to a flexible and sustainable culture is more likely to encourage eco-innovation and enhance effective communication among employees, thus ensuring sustainability is implemented. Eventually, employees will be motivated, thus providing sustainable customer service leading to increased sales and profitability throughout the hotel group. Moreover, sustainable culture will help to manage relationships with stakeholders and develop better practices in implementing innovative green practices. The standardised sustainable culture will encourage total quality management, green procurement strategies and recycling evaluation methods. As each hotel imbibes the Go-Green culture, the whole hotel industry will be successfully implementing green initiatives and also overcome barriers to it.

Online Platform and various approaches to educate customers

The hotel industry can sensitise customers about climate vulnerability by an online platform, whereby information is shared and customers can have better understanding of why to use sustainable initiatives in the hotel. The online platform will educate customers about green implementation. Furthermore, at each hotel's check-in, front office employees will provide explanations of sustainable implementation by guests. Moreover, customers will be provided discounts, loyalty points, vouchers, coupons and free gifts to encourage them to adopt a sustainable behaviour.

Creating synergies and partnerships between tourism sectors, organisations, governments, civil society, and academia

Currently, most of the organisations which are directly and indirectly related or impacted by tourism work in silos. There should be greater and more innovative collaborations and partnerships between these stakeholders so that they are able to come together, find, and apply solutions to the climate dilemma in terms of how mitigation and adaptation play a big role in limiting the challenges of the climate crisis within the tourism sector.

Process and Protocol activities for Adaptation and Mitigation

There is a requirement for assessing the need for suitable practices to adaptation and mitigation both globally and "location-specific research and evaluation activities are required, for instance: "Projecting current and future climate change impacts; assessing vulnerabilities including climate-related hazards (for effective decisions for climate risk management), evaluating resilience and adaptive capacity; and evaluating current and future adaptation and mitigation activities, including possible new opportunities that may arise from climate change."

Sustainability managers

Moreover, the Tourism Authority should encourage appointing sustainability managers in hotels to encourage sustainable development and maintain regular supervision over green performance. Sustainability managers will have better expertise thus; help hotels to overcome barriers to green implementation.

7. CONCLUSION

This study shed light on the different climate change related adaptation and mitigation strategies the Mauritian hotel industry implemented. Moreover, it makes a unique combination by integrating existing literature and primary data to identify the barriers to implementation of green initiatives in the hotel industry. The result revealed that green barriers negatively influenced the green performance, thus the above recommendation will help to remedy the situation and enhance sustainable implementation in the Mauritian hotel industry.

a. Predictors: (Constant), Governmental Barrier, Finance Barrier, Behavioral Barrier, Knowledge Barrier, Resource Barrier, Cultural Barrier, Competition Barrier

According to Table 13, 72.6% (Adjusted R Square) of variance in sustainable performance in the hotel industry in Mauritius is explained by the independent variables, such as knowledge barrier, resource barrier, cultural barrier, behavioural barrier, behavioural barrier and competition barrier. Furthermore, 27.4% of variance is for other variables not included in the model.

Table 2: ANOVA[a]

TOURISTS' VALUE-NORM-BELIEF AROUND WILDLIFE INTERACTIONS IN AOTEAROA NEW ZEALAND

Girish Prayag

Department of Management, Marketing and Tourism, University of Canterbury, New Zealand

Richard Aquino

Department of Management, Marketing and Tourism, University of Canterbury, New Zealand

Joanne Aley

Department of Conservation, New Zealand

Introduction

Human-wildlife encounters can confer psychological benefits to tourists, making these experiences pivotal in nature-based tourism (Curtin, 2009), and having implications for long-term attractiveness and sustainability of destinations (Chakraborty & Takenaka, 2023). While tourists' encounters with wildlife and the implications for such wildlife are well-documented (Higham & Shelton, 2011; Orams, 1994), the values-beliefs-norms (VBN) underpinning visitors' interactions with wildlife and the behaviors they enact around wildlife remain sparsely researched. In Aotearoa New Zealand, visitors have the opportunity to view and interact with endemic and endangered species such as the kea (*Nestor notabilis*), a nationally endangered and *taonga* species for Maori, in remote natural areas. While the scientific evidence on negative consequences of human interactions with kea is mounting (Gartrell & Reid, 2007; Orr-Walker et al., 2019), how tourists' contribute to them are less well understood. Integrating the VBN framework (Andresson et al., 2005) as applied to sustainability behaviours with human-wildlife encounters, this study answers two main research questions:

RQ1: Are there different segments of visitors to Aotearoa New Zealand based on their VBN and interactions with kea?

RQ2: Are these segments different on demographic/travelling characteristics and specific behaviors around kea?

Method

The overall study employs a multi-method approach (ethnographic, qualitative and quantitative) embedded in a sequential mixed-method design. However, in this paper *we report on the quantitative phase of the study*. An ethnographic study of visitors interacting with kea in visitor sites (Aley, 2020) revealed that kea-initiated interactions (i.e., kea approaching vehicles and visitors who were eating or with novel items) prompted certain behaviours (e.g., taking multiple photos and videos). This was followed by in-depth interviews with 36 visitors (domestic and international visitors) from January to April 2023. A survey was designed and administered to international and domestic visitors to Aotearoa New Zealand using a quota sampling approach based on the qualitative phase and established scales for VBN. The survey was pre-tested and administered in each of the top four markets to NZ (Australia, UK, US, and China) and the domestic market using an online panel provider. At the end of data collection useable surveys were as follows: (n=1212) for international visitors and (n=426) for domestic visitors. A two-step cluster analysis (Rundle-Thiele et al., 2015) was utilized to identify clusters based on VBN and these were subsequently profiled on demographic/travelling characteristics and behaviours around kea (e.g., feeding, taking videos, and luring).

Findings

Three segments were identified. Cluster 1 (Nobody's Perfect) has values, norms and beliefs that showed concern for both wildlife and kea but mainly ascribing responsibility to others in saving kea. Cluster 2 (Misguided Believers) has values that support wildlife but their norms and beliefs are not always aligned with sustainable practices around wildlife. Cluster 3 ((Un)Consciously Careless) has values that are problematic to some extent that translates into

beliefs and norms that do not always align with sustainable practices around wildlife. The three clusters were profiled on socio-demographic and trip characteristics and results indicate significant differences between the clusters. However, behaviours such as feeding and luring kea provided a crisper delineation of the clusters compared to demographic characteristics.

Conclusion

The study contributes to expand the wildlife tourism encounter literature by identifying how VBN shapes different types of interactions with wildlife and (un)sustainable practices around kea, having both theoretical and managerial implications.

ABSTRACT

While shopping has long been recognized as an important component of tourism activities to tourism revenue and economic contribution in destinations, rare academic attention has been put on the determinants of tourist shoppers' consumption patterns. This study aims to supplement the extant literature by systematically exploring the factors that shape retail tourism demand based on tourism demand theory, providing useful information for tourism policy formulation, pricing strategy, and destination promotions. Furthermore, understanding tourists' purchase behaviours and the allocation of their shopping budget across product categories is crucial for the retail sector.

To achieve this, this study introduces a two-stage approach to analyse retail tourism expenditure and the allocation of spending across different product categories. Various factors such as income, price levels, socio-demographics, and trip characteristics are incorporated to understand the decision-making processes behind tourists' overall retail tourism budgets and their distribution across product types. By examining these factors separately, the study provides a comprehensive framework for understanding the complexities of tourist shopping behaviour.

This study utilizes a pseudo-panel data model proposed by Deaton (1985) to analyse retail tourism demand across countries over time. Data from the retail tourism project conducted by World Travel & Tourism Council (WTTC) (2023), which includes 4,577 responses from 24 source markets spanning from 2011 to 2022, is employed in the study.

The study provides insights into tourists' expenditure priorities and the factors that influence their spending decisions, including personal preferences, cultural influences, price points, and product categories. This understanding allows businesses to develop targeted marketing strategies and diversify their product offerings in the retail tourism sector, enhancing their competitive edge.

The findings of the study have practical implications for destination marketing organizations (DMOs) and industry practitioners. DMOs can use the research outcomes related to the overall retail tourism budget to promote retail tourism as a whole and expand its magnitude. Individual practitioners can benefit from the findings on budget allocation for specific product categories, enhancing their competitive advantage and securing a larger market share.

Collaborative partnerships between tour operators, travel agencies, and retailers are essential for maximizing retail tourism revenues. Strategic partnerships can be formed to offer tailored experiences and promotions that cater to diverse tourist shoppers. Retailers can customize their strategies based on tourists' characteristics and preferences, targeting specific product categories and adapting to changes in shopping behaviour.

The study also highlights regional heterogeneity in tourists' retail tourism expenditure and budget allocations. Retailers should provide high-quality services to both Western and Asian tourists while tailoring their offerings to attract visitors from different source markets. By capitalizing on these opportunities, businesses can better cater to the preferences of tourists and enhance their competitive edge in the retail tourism market.

Key Words: Retail tourism expenditure; Product-type-specific expenditure; Pseudo panel data

WHAT DIFFERENCE DOES HUNTING MAKE IN THE LIVES OF RURAL COMMUNITIES: A HUNTER PERSPECTIVE

Prof P van der Merwe

Potchefstroom
South Africa

Introduction

Hunting tourism is increasingly conceived and utilized as an instrument of socio-economic development (Briedenhann, 2004). This is supported by the European Federation for Hunting and Conservation (FACE), which stated that "Hunting is often a significant social and cultural activity in many rural areas which has value in binding communities as well as offering useful social integration tools" (FACE, 2024). Typical social impacts of tourism in rural areas identified by Tovar and Lockwood (2008) are: it affects community attachment, cultural identity, traditions, and regional character; it involves interaction and feelings about tourists; affects morality, honesty, trust, politeness; the rights of residents; encourages public participation and enhances pride in the area to name but a few.

Mubangizi (2023) specified that rural communities in South Africa face various challenges, such as a lack of certain skills, education opportunities, financial constraints, poor service delivery by municipalities, and infrastructural development. A gap exists in the literature to understand the social effects of hunting on African and, more importantly, South African communities (Van der Merwe & Saayman, 2005; Lindsey et al., 2007; Saayman et al., 2011a; Saayman et al., 2011a; Van der Merwe et al., 2007; van der Merwe et al., 2014; SCI, 2015; Saayman et al., 2018). Consequently, the problem that this research addresses is determining the social impacts of hunting tourism on local communities in rural areas of South Africa as perceived by the hunters themselves.

Method

A quantitative research approach, namely convenience sampling, was followed. The target population for this study was the hunting fraternity consisting of hunting tourists, which falls under one overarching body, SUCo (Sustainable Use Coalition). Two surveys were conducted; the first survey focused on the international hunting tourists and the second was on the national hunting tourists of South Africa. The data generated by the survey was collated in Microsoft Excel®, and basic (descriptive) respondent characteristics were analyzed using the IBM Statistical Package for Social Sciences (SPSS) software. Descriptive statistical analysis summarizes all the data generated by the survey. A factor analysis was conducted, and a t-test to determine the differences between the two groups of hunters. Four hundred and 415 useable questionnaires were obtained for international hunters and 1864 questionnaires for local hunters.

Results

Profile of hunters

Table 1 portrays the profile of hunting tourists (international and domestic) in South Africa.

Table 1: Profile hunting tourists

	International hunting tourist	Domestic hunting tourist
Average age	57 years	47 years

Marital status	81% Married	82% Married
Highest level of education	39% bachelor's or equivalent	41% Diploma
Length of stay	9.56 nights	3.7 nights
Most preferred province	Limpopo	Limpopo
Male/Female	89% male	97% male
Country/Province of residents	83% USA	51% Gauteng (RSA)
Occupation	26% retired	26% Professional
Frequency of hunting trips	Three trips in a year	2.7 trips per year

Descriptive analysis of the social impacts of hunting tourism

The hunting tourists (Table 2) agree to fully agree that their hunting activities are generating an income for communities ($\bar{x}$=4.20), that job opportunities have increased ($\bar{x}$=4.15) and that cultural traditions are preserved for future generations ($\bar{x}$=4.14). The emphasis is thus on economic and cultural benefits, which were positively assessed. Hunting tourists seemed to be sure of their contribution to making the area safer and with fewer crimes ($\bar{x}$=3.28).

In-depth analysis of the social impacts of hunting tourism: distinguishing between international and national hunters

An exploratory factor analysis was undertaken to elucidate underlying dimensions within the dataset. This methodological approach unveiled three distinct factors: Revitalization (Factor 1), Empowerment (Factor 2), and Prosperity (Factor 3). To determine whether the perceptions of international and national hunters differ concerning the social impacts, a t-test was performed on the three social impact factors. Significant differences were found for Empowerment (p=0.000) and Prosperity (p=0.000). In terms of Empowerment, international hunting tourists ($\bar{x}$=4.32,SD=±0.79) agreed to a larger extent with the contribution made to local communities than local hunting tourists ($\bar{x}$=3.85,SD=±0.85).

Findings

The first finding of the research is that hunting tourism positively impacts livelihoods in rural communities. A second finding of the research is that multifaceted contributions are made. Hunting tourism contributes substantially to various aspects of rural communities in South Africa. These are in the form off job creation and employment opportunities for locals in roles such as guides, trackers, lodge staff, and artisans crafting souvenirs. The third finding is that it supports South Africa's wildlife conservation and sustainable wildlife use. The research emphasizes the integral role of hunting tourism in conservation efforts in South Africa and the sustainable use of wildlife by game farms/reserves. The fourth finding is that hunting tourism supports social exchange dynamics in communities. Both international and domestic hunting tourists are depicted as active participants in a reciprocal social exchange with rural communities which acknowledges the symbiotic relationship between tourism and local livelihoods, where positive interactions between tourists, in this case hunting tourists, and communities in rural areas lead to continued support for hunting activities in these rural communities. The fifth and last finding of the research is that although hunters are seen as a collective, there are different perspectives among international hunters vs domestic hunters about some of the social impacts.

Conclusion

On the question of what differences hunting makes in the lives of rural communities, the research found that hunting tourism in South Africa matters, and communities benefit from this activity. Hunting tourists believe this activity creates a better community life and improves rural communities' well-being.

ABSTRACT

Digital transformation (DT) is receiving increased attention in wine tourism, impacting the long-term competitive viability of organisations. DT is not uniformly defined in the literature causing confusion and suboptimal return on DT investments, adversely impacting wine tourism organisations which are slow to adapt to technological change. We explored leadership in wine tourism organisations' understanding of DT and how they can embrace DT for competitive success through reflective practice. Leadership focused on 'digitisation' without the requisite accompanying 'transformation.' We recommend leadership action, i.e. attention to transformation aspects. Specifically, staff skills and metrics to measure DT success/customer satisfaction to ensure success.

Keywords: Digital transformation, strategy implementation, business performance, leadership, wine tourism in South Africa, reflective practice

Introduction

Digital transformation (DT), an integral part of fast-paced technological advancement, receives intensified attention from scholars and practitioners. The heightened interest stems from several factors, notably: (a) DT's impact on organisations' economic viability through (customer) value creation, delivery, and appropriation – the essence of competitive advantage and crux of organisational strategy – a leadership accountability; (b) the lack of a uniform definition and understanding of DT; and (c) resulting in leadership being woefully unprepared to take advantage of DT benefits (cf. Busulwa et al., 2022; Harrington & Ottenbacher, 2016; Jayawardena et al., 2023; Schwab, 2016).

DT generally refers to leveraging technology that uses data-driven insights and concerns the changes technology brings to an organisation's business model, products, and/or organisational structure to enhance customer experiences and so securing the organisation's long-term competitive viability (Bilgili & Koc, 2022; Busulwa et al., 2022; Cheng et al., 2022; Gutierriz et al., 2021; Hadjielias et al., 2022; Hausberg et al., 2019; Jayawardena et al., 2023; Marx et al., 2021; OECD, 2020; Pesonen, 2020; Van Nuenen & Scarles, 2021).

This understanding of DT suggests an organisation must anticipate (be resilient) and pro-actively adapt (be agile) to take advantage of digital technological advancement. Benefitting from DT necessitates the organisation employing

suitably skilled staff, especially regarding their evolving competence to embrace DT (Busulwa et al., 2022; Carlisle et al., 2023; Hausberg et al., 2019; Holbeche, 2019, 2022; Marx et al., 2021; Rêgo et al., 2022).

This DT interpretation confirms its interwovenness with competitive advantage. Competitive advantage permits an organization to better serve its customers by performing value-creating activities superior to those of their competition. Competitive advantage arises from (a) the chosen competitive arena/s; (b) customer value, whether economic, functional, psychological, or a combination thereof; and (c) the availability of resources for delivering customer value in the chosen competitive arena (Barney, 1991; Morkel et al., 2021; Porter, 1985). Competitive advantage is accomplished through coordination and cooperation and arranged by the structural dimensions of organisation (framework and processes) for implementing strategy (Morkel et al., 2021; Skivington & Daft, 1991). The framework dimension includes aspects such as job design, policies, procedures, culture, leadership, systems, and training. The processes dimension provides for interaction and sanctions (Morkel et al., 2021; Skivington & Daft, 1991). Capitalising on DT can support successful strategy implementation and enhance long-term competitive/prosperous organisational performance. This also applies to the wine tourism industry, which comprises mostly SMEs.

Research shows that DT in wine tourism is neglected (cf. Garibaldi, 2023; Madzik et al., 2023), despite (wine) tourism being a globally important economic sector in terms of gross domestic product (GDP) contribution, employment, and visitor spending (Carlisle et al., 2021; Morkel et al., 2021; Vinpro, 2022; WTTC, 2022). However, (wine) tourism is a vulnerable sector as evidenced by adverse events, such as the 2008-financial crisis, 9/11, and the Covid-19 pandemic (Cheng et al., 2022; Madzik et al., 2023), threatening many organisations' existence. The vulnerability of (wine) tourism is exacerbated by its slow uptake of technological advancement, or the adoption of new tools (Madzik et al., 2023; Marlowe et al., 2021; OECD, 2020), which is attributed to the dominance of resource impoverished SMEs (OECD, 2020). If DT is not addressed, the wine tourism's economic viability may be in jeopardy. Hence, attention to DT in wine tourism is overdue. Addressing this neglected area of research is essential to gain knowledge that will aid the prospering of wine tourism organisations.

The purpose of our study was to explore wine tourism industry leadership's (a) understanding of digital transformation; and (b) how they can embrace DT through reflective practice, considering what promotes or hinders DT in their effort to innovate, create/deliver (customer) value, and ensure a competitive advantage to successfully implement the organisational strategy for sustained business performance. Our research questions were: (a) How does leadership in wine tourism understand DT? and (b) How can leadership embrace DT through factors/variables that impact the creation of an innovative environment, enhanced (customer) value creation/delivery, and ensure a competitive advantage facilitating successful strategy implementation? To answer the research questions, we briefly summarise the literature on DT, next. Then follows the methodology and thereafter the findings and discussion. The paper closes with conclusions, contribution, limitations and recommendations for future research.

Brief Summary of DT Literature

Successful DT vests with leadership (Busulwa et al., 2022; Harrington & Ottenbacher, 2016; Jayawardena et al., 2023; Pesonen, 2020). Hence, many organisations invest in DT, which is estimated at $6.8 trillion in 2023 (Chamorro-Prumizic, 2021). Yet, few organisations reap the benefits of this investment (Busulwa et al., 2022; Chamorro-

Premuzic, 2021; Pearce, 2020; Machado et al., 2021) because they are unprepared to take advantage of the benefits DT offers (Busulwa et al., 2022; Chamorro-Prumizic, 2021; Cheng et al., 2022; Machado et al., 2021; Pearce, 2020). Many reasons are offered for this poor return on investment. These reasons can be summarised as leadership failing to plan systematically and speedily adapt in anticipation of environmental changes impacting their organisation's long-term sustained competitive performance. Often, this indicates that there was a lack of involvement of their staff, including their evolving competencies to do their work, i.e. strategy execution (Busulwa et al., 2022; Carlisle et al., 2023; Hausberg et al., 2019; Holbeche, 2019, 2022; Marx et al., 2021).

By implication, leadership underestimates the steps required to successfully implement and embrace DT. This can be attributed mainly to an overemphasis of the 'digital' element to the detriment of 'transformation'. Organisations do not pay adequate attention to the adaptation or reconfiguration of the (total) organisation as system accompanying 'digitisation' (Busulwa et al., 2022; Chamorro-Premuzic, 2021; Cheng et al., 2022; Machado et al., 2021; Marx et al., 2021; Pearce, 2020; Rêgo et al., 2022; Rogers & Rogers, 2016).

The consulted literature claims that successful DT can be distilled into five steps viz.:

(1) a clear definition of DT, its purpose, and its impact on the direction of the organisation, meaning to align DT and strategy, i.e. creating, delivering, and appropriating value, chiefly customer-value,

(2) ensure that employees at all hierarchical levels are equipped with suitable competencies, whether technical or strategic, to support DT in delivering customer-value and serve other stakeholders, enabled by the business operating model as reflected in the structural dimensions of organisation for implementing strategy, and arranging coordination and cooperation,

(3) access to relevant data furnished by the appropriate metrics/measurements about variables affecting organisational performance, such as customers, employees, and business processes,

(4) forming the basis of analysis to provide insights to act upon, which depend on technology, and

(5) evaluate the results or outcomes of these decisions, actions, and processes in terms of their impact on the business direction, encapsulating its purpose, mission, vision, goals, and values. Leaders are accountable for the results and must ensure that the organisation arrives at its future destination, i.e. competitive economic viability.

Limited research on DT in wine tourism confirms that these steps are overlooked. Specifically, research demonstrates that wine tourism organisations broadly focus on a single element, namely, marketing and do not benefit optimally from DT. Wine tourism organisations tend to use social media platforms and smart applications as source of customer value creation and delivery. Primarily, because digital platforms are accessible to resource impoverished SMEs (Bilgili & Koc, 2022; Galati et al., 2018; Garibaldi, 2023; Hausberg et al., 2019; Madzik et al., 2023; Obermayer et al., 2022; Pencarelli, 2020). However, it is unclear whether (a) the use of digital platforms are coupled with the necessary security measures to protect customers' private information; (b) these organisations have the necessary information systems to accurately predict customer value enabling evidence-based decisions relating to the use of DT; (c) these organisations have access to the relevant/supporting infrastructure, including finance to fully capitalise on DT, (d) the adaptations to DT, if any, impact their competitiveness; and (e) their customers are satisfied with the use of DT.

This research finding of narrow use of DT by wine tourism organisations is in line with the experience of the primary researcher, AM. When utilised fully, DT supports strategy implementation through competitive advantage, arising

from coordination and cooperation and arranged by the structural dimensions of organisation for implementing strategy. Research has shown that wine tourism organisations fall short in this area (cf. Marlowe et al., 2021; Morkel et al., 2021).

On the other hand, this observation confirms the theory-practice divide, which is common in applied fields and disciplines such as wine tourism (Morkel et al., 2021). Therefore, our study aimed to advance knowledge in wine tourism to enable leadership to appropriately embrace DT to benefit their long-term competitive performance. To achieve this purpose, an exploratory study, specifically professional reflection, was used, which is well suited to perplexing practical problems (Fook, 2011; Greenberger, 2020).

Methodology: Professional Reflection

Limited extant research on DT in wine tourism dictated an exploratory approach. Given the applied nature of wine tourism and the ostensible theory-practice divide, this research (inquiry) aimed at generating knowledge (learning) that could be applied practically to improve (professional) practice (Fook, 2011; Greenberger, 2022; Maddux & Donnett, 2015; Mortari, 2015).

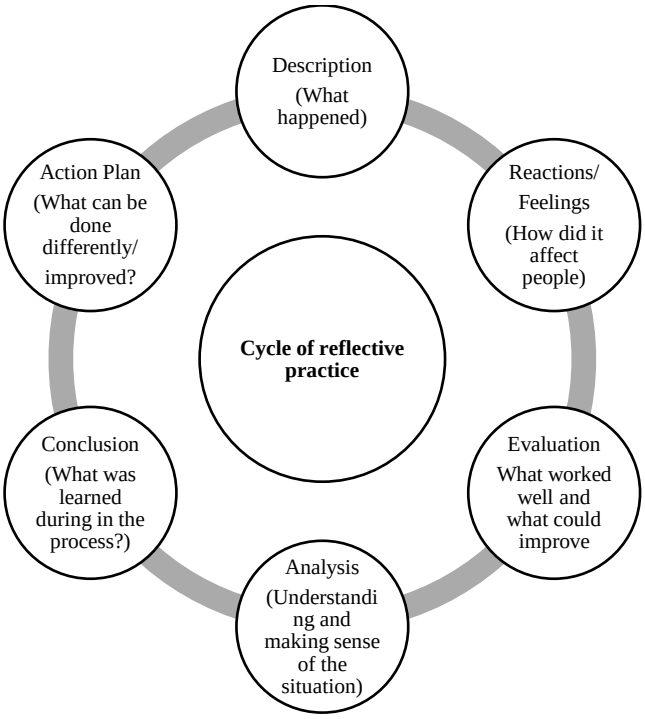
There are many ways to learn through everyday experiences, one of which is reflection (Greenberger, 2022; Mortari, 2015). One of the main philosophical approaches to reflection is pragmatism (Greenberger, 2022; Maddux & Donnett, 2015; Mortari, 2015). Pragmatism, as conceived by Dewey (1910, 1933), who inspired Schön, Kolb, Gibbs, and Johns (SAGE, 2014), is an approach for increasing an action's effectiveness. Thus, reflection is action oriented.

Reflective practice involves thinking about what one has done after completing an action, or while one is still engaged in the activity (SAGE, 2014). In a professional context, reflection is known to be beneficial in experiential learning, and for the development of critical thinking skills, which facilitate fusing theory and practice and, thus, overcoming the theory-practice divide (Fook, 2011; Greenberger, 2020; Ukko et al., 2017).

Reflective professionals and practitioners aim at understanding an action or experience to gain control over it (Mortari, 2015). Understanding entails thinking, a cognitive process that also incorporates emotions, subconscious elements, and active experimentation (Greenberger, 2022; Ukko et al., 2017). Thinking, according to Dewey's perspective, occurs when things are perplexing, uncertain, doubtful, or problematic and need solving (Greenberger, 2020; Maddux & Donnett, 2015; Mortari, 2015). The elements of Dewey's reflective practice can be described in terms of the following cycle and are illustrated in figure 1 below:

1. Description: (a) What happened? (b) What was my role? (c) What feelings/emotions surrounded the event?
2. Analysis: What were the setting and primary elements observed?
3. Synthesis: What prior learning (theory or experience) is relevant? What is the 'bigger picture' and did I consider all the elements?
4. Evaluation: In what areas did I make progress? What are the weak points?
5. Develop an action plan for improvement/implementation.

Figure 1: Reflective cycle



Source: Schön, 1991 (Adapted by the Authors)

Figure 1 is consistent with the suggestion of scholars (Fook, 2011; Greenberger, 2022; Ukko et al., 2017), to use structured frameworks comprising the features of Dewey's reflective cycle. Such frameworks facilitate reflective research and practice, as one of the main barriers to reflection is a lack of expertise on the method. Our findings and the discussion follow the Figure 1 framework.

Findings and Discussion

The first challenge transpiring in the literature on the topic, and observed in practice, is the complexity and consequent confusion around the meaning of DT. Digital transformation, digitalisation, and digitisation are often used interchangeably in literature.

1. Description: (a) What happened?

DT is a buzzword in wine tourism. Participating leadership's response to DT refers to 'digitisation' of aspects of the business, such as marketing and sales or booking systems. They confirmed that they invested in 'DT' projects, such as e-commerce platforms, PR or online sales initiatives and in social media marketing on platforms, such as Facebook, Instagram or TikTok. However, they listed resource constraints, specifically a lack of finance and of people with the requisite competence, as obstructing any further progress. Organisations without such constraints can pay more for the services of DT-competent employees, while smaller organisations cannot compete with those firms regarding attracting and appropriately remunerating the relevant staff.

Although leadership used the word DT, their understanding of the DT projects they described refers to digitisation, as defined in the literature. Leadership, of both small and large organisations, did not refer to the necessary accompanying organisational change and adaptation or transformation to ensure the 'digitisation' success. For example, on discussing

their use of DT, they indicated that they did not have metrics or measurements in place to track customer satisfaction with e-commerce or social media marketing. This points to a lack of organisational adaptation or change accompanying digitisation. This omission could have adverse consequences for the organisations' competitive advantage, the hallmark of a sound strategy and foundation for prosperous long-term competitive performance.

Providing customer value is attained through the structural dimensions of organisation for implementing strategy. Competent people must fill the positions and evolving their skills must be taken care of through training. Metrics to track customer satisfaction can be catered for by systems, while privacy of customer information is also addressed by these systems. All these variables are integral to the framework structural dimension of organisation for implementing strategy as discussed.

(b) What was my role? The lead author probed leadership's understanding of DT regarding (a) 'digitisation' vs 'DT' and (b) the transformation that must accompany DT, and (c) the effect on sustainable, long-term competitive performance. Their responses were evasive. Leadership's view of DT concurs with some literature that suggests 'digitisation' is equal to DT and consequently, leadership paid attention to some aspects of digitisation (marketing and sales) rather than DT, while they neglected the essential transformation or organisational adaptation to support successful DT.

(c) My feelings/emotions about the event/incident. The lead author had mixed feelings. On the one hand, it was surprising that the leaders did not have a thorough understanding of DT as literature describes it. On the other hand, realised that the literature is confusing and thus, one cannot expect participants to be 'clear' regarding the understanding of DT. Reflection led to the view that this lack of knowledge among leadership could well be a contributing factor in the failure of optimal strategy implementation prevalent in the wine tourism industry (cf. Morkel et al., 2021). I also accepted that leadership in wine tourism, specifically in SMEs, often hold multiple roles and cannot be expected to be experts in all. However, they can be expected to be able to implement measurements and systems, if they intend to become and remain competitive and relevant.

2. Analysis

The primary setting alludes to the fact that South African wine tourism leadership participating in this study seemed to consider themselves "somewhat forced" to adopt technology and DT – either by the industry, other organisations, their clients or staff. This appears to be a perceptive assumption. Such a move is not an organically grown transformation, but rather a sudden requirement, they do not feel that they are ready and well-prepared, and that they could not plan for the rapid changes the onset of the Covid-19 lockdowns required of them, or the changes it would cause in customer behaviour (e.g. the generational adoption of technology). It further appeared that leadership had also not been ready for DT at the time because of financial constraints, employee skills scarcity, and a lack of understanding what exactly align with strategy or what measurement metrics are needed for customer value creation.

They also did not have the appropriate systems in place to track data to make evidenced-based decisions. Often, these decisions were left to HR or marketing managers, who were ill-prepared to deal with DT transformation, especially regarding organisational strategy. HR managers in wine tourism traditionally tend to select employees on skills such as tourism and wine/product knowledge, instead of having to appoint employees to manage technology that are aligned with strategy. Marketing managers tend to focus on wine service-selling and are being propelled into

functions, such as digital marketing, business analytics, and content management, new skills that they must acquire to be considered effective. Leadership did not seem to be clear on how these lacking skills can affect their employees and their performance. Thus, leadership training to enhance their understanding on competencies could impact future transformation success.

3. Synthesis

The extant literature on the topic converges on a definition of DT as leveraging technology by using data-driven insights and concerns the changes technology brings to an organisation's business model, products, and/or organisational structure to enhance customer experiences and so securing the organisation's long-term competitive viability. Thus, DT suggests an organisation must anticipate (be resilient) and pro-actively adapt (be agile) to take advantage of digital technological advancement. Benefitting from DT necessitates an organisation having the suitably skilled people, particularly their evolving competence to embrace DT. Leadership does not have to be experts in DT, but they could benefit from access to 'technical wizards' to understand their role in making the most of DT in the organisation. Failing to do so will inhibit the organisation from benefitting from isolated digitisation and limited DT. As leadership had an incomplete view of DT, based on the focus on digitisation to the exclusion of 'transformation', and they did not realise what structures or systems it needed to put in place to make data-driven decisions to speedily adapt to anticipated change to remain competitive.

Organisation's also lacked DT-skilled employees and as it did not own suitable metrics (systems) to track customer satisfaction with value obtained. This absence could obstruct their resilience and agility and jeopardise their organisation's competitive long-term performance. The significance of considering customer satisfaction as example when implementing DT is imperative, as satisfied customers are returning customers and they ensure the economic viability of the organisation. Such tracking systems should be geared towards the differences between different customer segments.

Leadership should consider: a) what elements of DT are important for achieving and measuring customer satisfaction by virtue of customer value needs, b) aligned with the organisation's strategy and c) elements that could enable leadership to successfully embrace the benefits of DT. Factors such as privacy of customer information, continuous learning, and understanding the value of platform-specific analytics for strategic decision-making seem unknown by the leadership and thus, inadequately addressed.

4. Evaluation

Leadership seemed to understand the importance of DT in terms of 'digitisation'. They did, however, lack the requisite accompanying 'transformation', which concerns employees' skills and the system requirements to track customer satisfaction with digitisation. These 'transformation' aspects could have a positive impact on competitive advantage, strategy and the long-term competitive viability of the organisation.

These observations are consistent with the discussed literature. This reflection identified the importance of understanding what exactly DT should entail, which is critical to ensure the focus is on the short- and long-term future of the organisation, instead of leadership focusing only on digitised marketing and sales, without any measurements regarding customer satisfaction. Leadership needs to consider that all elements are interrelated, and when considering DT, they also must include transformation, aligned with organisational strategy. Specifically, attention to

structure/systems/processes, an integral part of the framework stucrual dimension of organisation for implementing strategy to enable successful implementation.

5. Action plan

The outcome of this reflective study suggested that leadership should (a) adopt the DT definition encompassing both 'digital' and 'transformation'; and (b) aim to apply the 5-steps identified in this study for effective/successful DT implementation. Specifically, this highlights the need to enhance (through the appropriate training) employees' skills and competencies; to implement the metrics to measure customer-specific values and satisfaction in alignment with the organisation's strategy; and observe the legal requirements by e.g. the POPI Act for data privacy. This will necessitate the following steps.

(a) Consider the technology or infrastructure needed for DT (once leadership understands what it is),

(b) Consider suitable skills required for DT implementation, including continued education/training of staff,

(c) Consider ongoing data analysis provided through relevant metrics,

(d) Consider the value of practicing reflective leadership.

Conclusion, Contribution, Limitations, and Recommendations for Future Research

In *conclusion*, the study answered the research questions and thus provides a better understanding of DT in wine tourism and identifies areas that assist leadership in wine tourism to embrace digital transformation for competitive success. Specifically, (a) evolving staff skills to embrace DT and (b) appropriate metrics to track customer satisfaction with DT. These variables form an integral part of the framework structural dimension of organisation for implementing strategy.

The study *contributes to knowledge*, despite its limitations. As can be expected, the definition and consequent understanding of DT impacts its adoption in practice. The ambiguous definitions in the literature impact the practical application. There is more to DT than mere digitisation. The digitisation should be accompanied by appropriate organisational adaptations to ensure its success. In this instance evolving staff skills and necessary systems changes to measure and track customer satisfaction. These changes are integral to the framework structural dimension of organisation for implementing strategy.

The *main limitation* of this study is that reflective practice is time-consuming. Thus, only a limited number of role players participated in the study.

Hence, *further reflective inquiry* is warranted, especially on actions taken following the reflective inquiry i.e. adaptations to the framework dimension of organisation for implementing strategy. This study provides preliminary insights and further studies could support leadership to improve the implementation of strategy by embracing DT. Future studies can reflect on the outcomes of the action plan to assess the effectiveness on DT adoption.

Finally, it stands time for theory and literature to get in the same bottle as practitioners in the wine tourism industry, and for leadership to embrace this by understanding what DT is, and what it is not. It is plausibly essential for an organisation's survival. In Vino Veritas (*In wine there is truth*). Leadership needs to find and understand the truth around DT to improve strategy, enhance competitive advantage and ultimately ensure customer value and performance, through the benefits of DT.

CUSTOMER CENTRICITY IN SOUTH AFRICAN BANKS: DEVELOPMENT OF A CONCEPTUAL MODEL

Madéle Tait

Nelson Mandela University

George

South Africa

ABSTRACT

The four major banks in South Africa closed almost 700 branches during 2012-2023 and expanded their digital services to keep up with fintech businesses competing for their customer base. The purpose of the research study was to determine customer centricity in South African Banks. The most important findings of the research were that the physical bank branch continues to play an important role, despite of digitilisation.

Key Words: customer centricity, South African Banks

BACKGROUND

The four major banks in South Africa - Absa, First National Bank (FNB), Nedbank and Standard Bank - closed almost 700 branches during 2012-2023 and expanded their digital services to keep up with fintech businesses competing for their customer base. The radical digital transformation of the financial services branch of industry severely impacted the most vulnerable in society. More than 19 million people in South Africa are still offline, meaning that almost 32% of the population depend on cash and have limited access to banks. In 2020 the Covid-19 pandemic sparked further digital transformation and in 2021 the destruction of the Zuma riots caused further branches and ATMs to close. All four the nation's traditional banks closed branches in KwaZulu-Natal and Gauteng as a result. The destruction of bank branches and ATMs hampered the ability of South Africans to draw salaries, pay for their daily needs and businesses to operate and pay their staff and suppliers. It also had a devastating impact on the South African Social Security Agency beneficiaries.

METHODOLOGY

The research study consisted of two phases. The first phase was a preliminary desk study and the second phase involved qualitative multiple methods (face-to-face interviews were conducted and the Microsoft Teams platform was used where face-to-face interviews were not possible). The population was personal bankers of the four largest retail banks in South Africa, namely Absa, First National Bank, Nedbank and Standard Bank. Non-probability snowball sampling was used and the total number of participants was 25, which included all nine provinces of South Africa. The participants were recruited by means of an e-mail or phone call to the retail banks and enquiring about the number of personal bankers in the respective banks. Thematic analysis was used to analyse the data. Deductive and inductive codes were used to develop themes.

FINDINGS

The most important findings and recommendations of the research were: the physical bank branch continues to play an important role. As a point of access to cash and value-added services for both individuals and companies, the bank branch reinforces its relevance in a consulting and sales space. Banks should carefully consider the impact of the closure of branches and ATMs on consumers. Prior to the closure of a branch, a bank should conduct a robust needs analysis of the financial consumers that use the branch or ATM. Many consumers still prefer face-to-face communication in bank branches and because of this, a conceptual model has been developed to focus on the unique blend of renewing the digital offer, while enhancing the strengths of the branch.

MEASURING AND ASSESSING THE ECONOMIC, ENVIRONMENTAL AND SOCIO-CULTURAL IMPACTS OF HOT SPRINGS: CASE STUDY HOT SPRINGS IN REGIONAL AUSTRALIA

Gaelle Hugues Gregoire Joson
Victoria University
Melbourne, Victoria, Australia

Joanne Pyke
Victoria University
Melbourne, Victoria, Australia

ABSTRACT

For years, hot springs have been recognised as having potential benefits to the economy, the environment, and their local community. This paper explores how the impacts of hot springs can be measured, applying a mixed-method research approach. The first phase involved using the Delphi Technique to develop indicators, while the second phase employed a case study approach and a visitor survey to provide a comprehensive view of the multifaceted impacts of hot springs. The results revealed that hot springs have a positive impact on local economies by creating jobs and generating tourism revenue, while also serving as cultural and recreational spaces for the community. However, hot springs do present challenges related to environmental sustainability, highlighting the need for holistic approaches to manage and evaluate their long-run impacts.

Key Words: Wellness tourism; Hot springs tourism; Economic impacts; Environmental impacts; Socio-cultural impacts

INTRODUCTION

Tourism plays an important role in driving economic development in regional Australia, with hot springs becoming an increasingly important visitor attraction. For centuries, people have experienced the natural geothermal features known as hot springs for their therapeutic and recreational benefits. However, beyond their recreational value, hot springs are gaining recognition for their potential to generate economic opportunities, support cultural practices, and contribute to environmental conservation efforts. As the wellness tourism sector continues to expand globally, so does the development of hot springs. Nevertheless, as they grow in scale and significance, the impacts of hot springs encompass socio-cultural, economic, and environmental dimensions that require investigation. This paper presents a method of how these impacts can be usefully measured enabling comparisons between hot springs operations and providing a basis for operational benchmarks.

LITERATURE REVIEW

The wellness tourism industry is experiencing rapid growth worldwide as individuals seek ways to de-stress and enhance their overall well-being. This form of tourism emphasises the promotion of health and wellness through diverse physical, psychological, and spiritual activities. To fully understand the evolution of the wellness tourism industry, the terms wellness and wellness tourism need to be defined. According to the Global Wellness Institute, wellness is defined as “the active pursuit of activities, choices, and lifestyles that lead to a state of holistic health” (Global Wellness Institute, 2021, p. 1). Meanwhile, wellness tourism is defined as “travel associated with the pursuit of maintaining or enhancing one’s personal wellbeing” (Global Wellness Institute, 2021, p. 71). Both definitions emphasise not only the absence of illness or disease but also a proactive approach to maintaining and enhancing health (Stará & Peterson, 2017).

In 2022, the industry was valued at $5.6 trillion and includes various sectors that enable consumers to incorporate wellness routines into their daily lives. Notably, this includes spas and springs, each with a value of $105b and $46b, respectively (Global Wellness Institute, 2023). These figures illustrate the significance and economic influence of these industries in the global wellness economy.

As an emerging form of spa tourism, hot springs tourism is a rapidly growing sector of the wellness industry. It is centered around natural geothermal hot springs. While there is no exact definition of hot springs tourism, it is generally

understood to encompass travel activities centered around visiting and experiencing natural geothermal hot springs for relaxation, rejuvenation, and therapeutic purposes. These activities can include soaking in hot mineral waters, enjoying spa treatments, participating in wellness programs, and exploring the surrounding environment. A wealth of literature has been conducted on consumer behavior, tourist motivations, satisfaction, and loyalty relating to spa destinations (Azman & Chan, 2010; Clark-Kennedy & Cohen, 2017; Mi, Chen, Cheng, Uwanyirigira, & Lin, 2019). Despite the relative newness of this niche market, existing literature has already shed light on the industry's potential and the unique experiences it offers. However, much of the research to date has focused on evaluating the spa and wellness tourism industry with no particular focus on its impacts on the economy, the environment and on its community.

Hot springs in Australia often occur in unexpected locations, with many fed by the Great Artesian Basin, which occupies a quarter of the continent (Erfurt, 2021; Lambert & Jenni, 2011). An example is Cunnamulla Hot Springs in Outback Queensland, Australia, sourced from the Great Artesian Basin. Although there are no active volcano in Australia, the Earth's molten core radiates enough heat to warm groundwater that rises under pressure from an aquifer to the surface using bores and wells (Erfurt, 2021, p. 22). The unique geological characteristics of Australian hot springs, alongside their cultural and historical significance contribute to their appeal as wellness destinations. Throughout Australia's history, indigenous communities have used hot springs for healing purposes via traditional knowledge and cultural practices (Erfurt, 2021; Waterwise Queensland, 2021). The benefits of soaking in hot waters for health and wellbeing have since endured, with a growing interest in wellness tourism experiences. The popularity of wellness tourism experiences in regional Australia has seen significant growth, with a 9.6% increase in visitors from 2015 to 2019, and this trend is expected to continue as more people prioritise their health (South Australian Tourism Commission, 2021; Tourism Australia, 2019). As a result, hot springs are set to become increasingly popular among those seeking unique and rejuvenating wellness experiences. In addition, Australia being home to a growing number of geothermal and mineral springs (Sykes, 2019), which presents an important opportunity for regional economic development. However, there is little academic research on the impacts of hot springs, making it important to explore their role in regional development to better understand their benefits.

The hot spring industry holds great promise for driving sustainable development in destinations (Law, De Lacy, Lipman, & Jiang, 2016). By shifting from a transformative to a regenerative perspective (Gibbons, 2020), hot springs emphasises the transformation of destinations in a way that benefits the economy, environment and socio-cultural aspects. The concept of "regenerative" involves a holistic approach that goes beyond avoiding negative impacts and instead, seeks to restore and enhance natural and cultural heritage, generate economic benefits, and promote well-being (Ateljevic, 2020; Cave & Dredge, 2020; Pollock, 2019; Zari, 2009). Therefore, measuring progress through indicators can ensure that the benefits of hot springs tourism are distributed fairly among the community and work towards achieving sustainability goals.

Various indicator schemes have been established in the field of tourism such as sustainable tourism, green economy and the European Tourism Indicators Scheme among others (European Union, 2016; Law, DeLacy, & McGrath, 2017; World Tourism Organization, 1996), with the goal of measuring and monitoring global, national and destination-level impact of tourism. At present, tourism performance measures currently prioritise economic benefits, neglecting broader impacts on society and the environment. Furthermore, these schemes are generally used and adapted within a broad framework for tourism and contain a considerable number of indicators. A sustainable approach to tourism indicators should encompass economic, environmental, and socio-cultural aspects (UNWTO, 2013). Stakeholder engagement is also important in developing this framework as it can provide insights into industry limitations and opportunities. However, there is a lack of specific indicators for measuring the impacts of hot springs suggesting the need for specific sets of economic, environmental, and socio-cultural indicators that are easy to use and apply. Existing indicator schemes for the tourism industry may not be fully adaptable to the unique characteristics of hot springs destinations at both a regional and individual level. Therefore, creating tailored indicators will be valuable for monitoring the progress of both individual operations as well as the progress of the wider industry. The intention is that the indicators will provide a tool for management decision making as well as to provide benchmarks for industry performance.

METHODOLOGY

The methodology employed in this research comprised of two phases aimed at developing and testing indicators to measure the sociocultural, economic and environmental impacts of hot springs in regional Australia.

In Phase 1, the Delphi technique was employed to systematically gather expert opinions and insights to develop a reliable set of indicators (Dalkey & Helmer, 1963; Garrod & Fyall, 2005).This technique involved assembling a panel of global experts from relevant fields including local government, hot springs businesses or shareholders, tourism destination compagnies around the world and academics. A total of 33 experts were gathered around the world from Australia, New Zealand, Vietnam, Poland, USA, Germany, China Morocco, England, Italy, Austria, Japan and Switzerland. Through a series of structured questionnaires and iterative rounds of feedback, consensus was sought on the key indicators that would comprehensively capture the multifaceted impacts of hot springs. This approach has been widely utilised in tourism and hospitality literature as a means to anticipate future developments (Kaynak, Bloom, & Leibold, 1994; Miller, 2001). Specifically in this study, it facilitated comprehensive information gathering about an important issue while fostering independent analysis among experts. This method has proven valuable for establishing research frameworks and obtaining reliable insights.

Following the indicator development in Phase 1, Phase 2 employed a case study approach to test the validity and applicability of these indicators in hot springs in regional Australia. The research included four case studies sites which were Peninsula Hot Springs, Metung Hot Springs, Phillip Island Hot Springs in regional Victoria and Cunnamulla Hot Springs in Outback Queensland (see *Figure 1*). It is important to note that at the time of data collection, Peninsula Hot Springs was a well-established hot spring business while Metung Hot Springs has just opened in January 2023; Phillip Island Hot Springs and Cunnamulla Hot Springs were set to open in 2024. These sites represented a diverse range of geographical, environmental, cultural and economic contexts. Various methods were employed for data collection, including a visitor survey and the analysis of secondary data sources such as government reports, tourism statistics and environmental assessments.

The visitor survey was sent to visitors to Peninsula Hot Springs and Metung Hot Springs. The visitor survey aimed to evaluate visitor spending, travel party, activities done at the destination and hot springs facility, as well as behaviours, experiences, and potential health benefits associated with the use of the hot springs. The questions were designed to gather both quantitative and qualitative data. The goal of the testing phase was to enhance a standardised set of indicators applicable to all hot springs' sites, creating a benchmark for performance evaluation. The upcoming section presents an overview of the discussion on preliminary findings from Phase 1 and Phase 2.

Figure 2 - Map of Australia showing the four hot springs case studies.

PRELIMINARY RESULTS

PHASE 1

The final set of indicators are not available for publication at this time. However, the following discussion outlines the themes covered by the framework (see *Figure 2*). A total of 26 potential indicators were formulated by the experts. These indicators offer a comprehensive evaluation of the sociocultural, economic, and environmental impacts of hot springs on visitors, communities, and destinations.

The selection criteria for these measures encompassed their relevance to the issue at hand, feasibility in data acquisition and analysis, objectivity and credibility of information, user clarity and comprehensibility, as well as comparability over time and across different regions.

Under the economic theme, direct and indirect economic impacts of hot springs in their destinations were identified where relevant indicators were readily identified by the expert panel. Most of these indicators were derived from the visitor survey along with secondary datasets.

The following themes, climate change and energy, waste and biodiversity were identified under the environmental category. Understanding and quantifying the environmental impacts of hot springs on its destinations was critical to comprehend. Obtaining some environmental impact metrics will involve sourcing business reports from operators while others will require specific calculations.

Addressing socio-cultural considerations presented significant challenges during this research. Themes within this category included direct health impact on users/visitors, sense of wellbeing at an individual and community level, health benefits, and the bathing culture in the region. Developing indicators for both individual (mental and physical health benefits) and community assessment proved to be important in this study. It was essential to understand not just why individuals visit but also whether there are tangible impacts on their health due to visits which can inform broader societal implications such as mental wellness or operator's interaction levels within adjoining communities.
These measurements predominantly relied on the visitor survey and secondary datasets such as local government statistics and annual accounts offered by hot spring businesses.

The development of these indicators aims to be applicable to hot springs worldwide and contribute to establishing a benchmark that supports growth with the global hot springs industry.

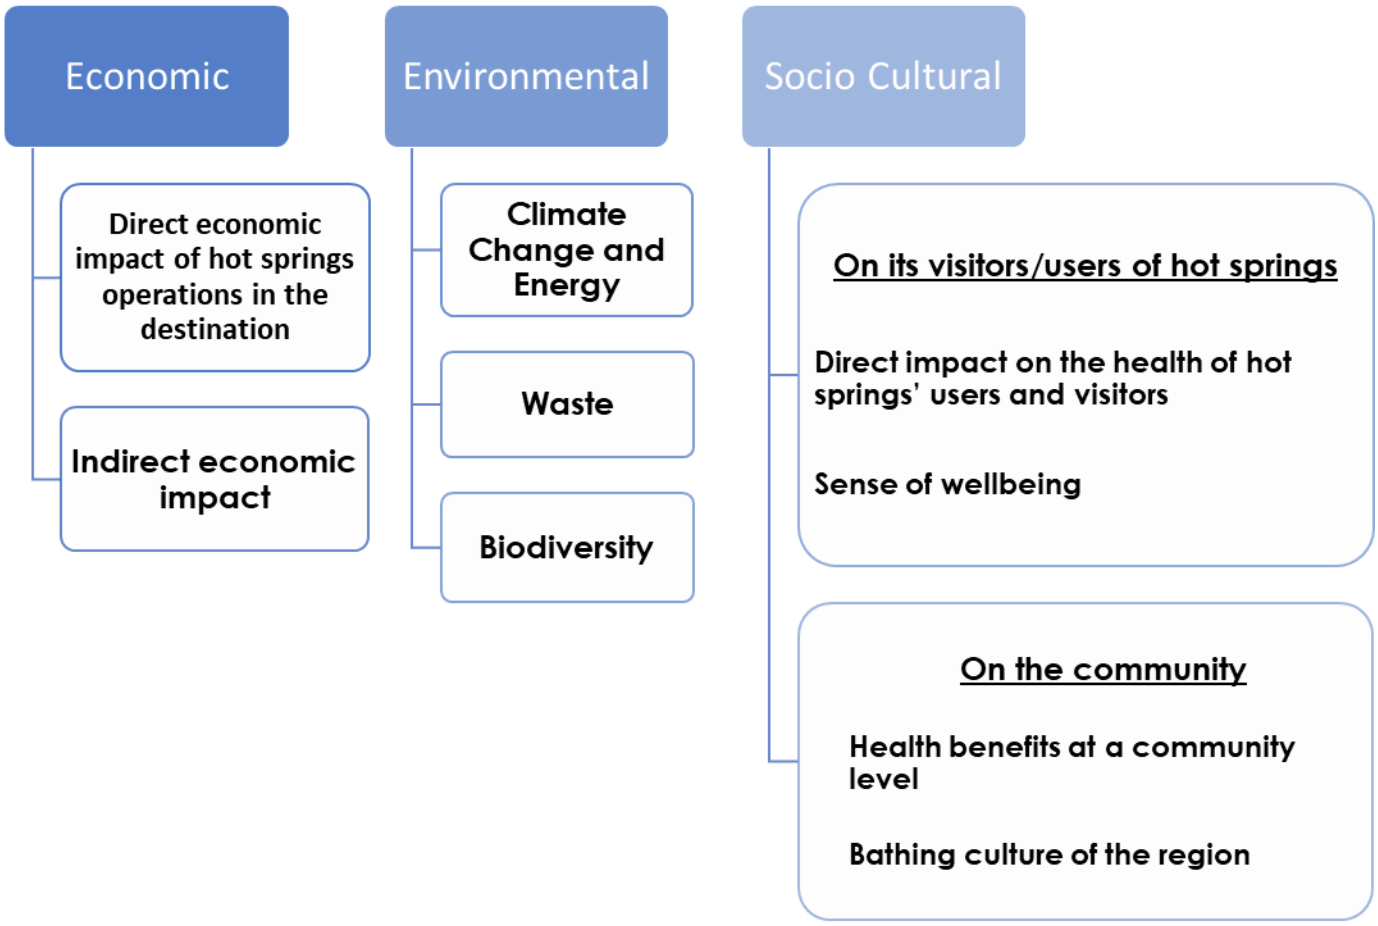

Figure 3 - Indicator framework created based on the experts' responses.

PHASE 2
The primary objective of the visitor survey conducted as part of this research was to establish a baseline data for the hot springs industry in Australia. By gathering insights from a sample of visitors to Peninsula Hot Springs and Metung Hot Springs, the survey aimed to capture key demographic information, travel behaviour patterns, motivations for visiting hot springs and the destination, and perceptions of the overall experience. In addition to the visitor survey, secondary data was collected to supplement the research findings. The secondary data encompassed a wide range of

indicators, including environmental metrics, indirect economic impacts and socio-cultural factors. This baseline data serves as a foundation for future research and allows for comparisons in the future and trends in hot springs tourism.

KEY FINDINGS FROM THE VISITOR SURVEY

The survey yielded key findings into economic, environmental and sociocultural impacts of hot spring, which will be further elaborated in the discussion section.

Economic Impacts

Quantitative analysis of survey data indicates that hot springs tourism generates substantial economic benefits for regional economies. Visitors spend money on accommodations, dining, shopping, and recreational activities, stimulating local businesses and supporting employment opportunities. However, there are discrepancies in the distribution of economic benefits, influenced by factors such as the size and popularity of the hot springs as well as the tourism infrastructure in each destination.

Environmental impacts

The results reveal valuable insights into the sustainability practices of Peninsula Hot Springs and Metung Hot Springs which shed light on their strengths as well as areas for improvement. Both facilities have demonstrated their commitment to preserving biodiversity and implementing effective waste reduction strategies. However, the absence of data transparency raises concerns about their emissions and waste management practices and underscores the necessity for better tracking and reporting mechanisms. As such, these initiatives can serve as a model for integrating sustainable practices into future projects.

Sociocultural impacts

The analysis unveils the sociocultural impacts of hot springs on visitor experiences, community engagement and overall wellbeing. Visitors also demonstrated appreciation for the therapeutic and recreational benefits of hot springs, contributing to their sense of well-being and relaxation. Positive impacts encompass improved wellbeing, visitor satisfaction as well as cultural and community engagement. Areas that could be improved include local involvement and mental health assistance. One of the areas for improvement is local resident engagement and mental health support.

DISCUSSION

The results of this research highlight the relationships between the sociocultural, economic, and environmental aspects of hot springs. Although these natural features provide substantial advantages to communities and economies, they also present difficulties in terms of sustainable environmental practices and resource management. It is hence important for stakeholders to work together collaboratively to maintain a balance between safeguarding cultural heritage and advancing economic growth while preserving the environment. These findings can inform the development of future hot springs projects, with lessons learned from both facilities.

CONCLUSION

This research has explored the multifaceted dimensions of hot springs tourism in regional Australia and underscored its significance as a driver of sociocultural, economic, and environmental development. The findings highlight the importance of adopting holistic and sustainable management practices to ensure the long-term viability of hot springs as valuable assets for present and future generations. Through collaborative and inclusive approaches to management, the industry can foster community wellbeing and conserve natural resources.

ABSTRACT

The carbon market plays a crucial role in advancing carbon emission reduction initiatives and achieving carbon neutrality goals. However, existing models and strategies within the carbon market often fail to effectively capture the complex interplay between carbon offsetting, market dynamics, and pricing fluctuations. This paper introduces a novel approach that integrates deep learning techniques with carbon offsetting concepts to enhance the precision and efficacy of carbon market modeling and trading strategies. By employing a combination of Convolutional Neural Networks (CNN) and Bidirectional Long Short-Term Memory Networks (BiLSTM) with a cross-attention mechanism, this method improves upon traditional models by effectively capturing spatial and temporal patterns in carbon market data. The efficacy of the proposed method is validated through extensive experimentation with real datasets, demonstrating its superiority in enhancing carbon market forecasts and optimizing trading strategies.

Key Words: carbon neutrality, deep learning, sustainable tourism

INTRODUCTION

The carbon market has emerged as a pivotal mechanism for mitigating climate change by regulating and pricing carbon emissions. It plays a critical role in guiding industries and economies towards sustainable practices and achieving global carbon neutrality targets. The effectiveness of carbon markets hinges on accurate modeling and prediction of carbon prices, which are influenced by complex factors including market dynamics, policy changes, and economic indicators. However, traditional carbon market models often struggle to capture these complexities, leading to inefficiencies and inaccuracies in carbon trading strategies.

The urgency to enhance carbon market efficiency is compounded by the escalating impacts of climate change, necessitating more robust tools that can provide deeper insights and more accurate forecasts. This necessity drives the exploration of advanced technological solutions capable of addressing the inherent challenges of carbon market modeling. Among these, deep learning technologies offer promising capabilities due to their proficiency in handling large datasets and capturing intricate patterns in data.

This paper introduces an innovative approach that integrates Convolutional Neural Networks (CNN) and Bidirectional Long Short-Term Memory Networks (BiLSTM) with a cross-attention mechanism, specifically tailored to refine carbon market modeling and trading strategies. This integration aims to leverage the spatial pattern recognition strength of CNNs and the temporal data processing capability of BiLSTMs, enhanced by the selective focus of cross-attention mechanisms. These features are particularly adept at dissecting the temporal and spatial dependencies within carbon market data, potentially leading to more precise predictions and effective trading strategies.

By addressing the limitations of current models, the proposed CBSTM framework with cross-attention not only aims to improve the accuracy of carbon price forecasting but also to optimize carbon trading strategies, thus contributing to more effective carbon management and supporting global efforts towards achieving carbon neutrality. The implementation of such advanced modeling techniques in carbon markets is expected to provide substantial benefits, including enhanced regulatory compliance, better market stability, and increased investor confidence, all of which are crucial for the transition towards a low-carbon economy.

In this paper, will detail the development and application of this novel deep learning model, evaluate its performance against traditional methods, and discuss its implications for the future of carbon markets. Through this comprehensive approach, we aim to showcase how integrating cutting-edge AI technologies can revolutionize carbon market analytics and help meet the urgent demands of climate change mitigation.

RELATED WORK

The evolution of carbon market modeling has been marked by the gradual integration of more sophisticated computational techniques to address its inherent complexities and improve prediction accuracy. This section reviews relevant studies and methodologies that have influenced the development of the proposed CBSTM model with a cross-attention mechanism, highlighting the progression from traditional econometric models to advanced machine learning approaches.

Econometric Models: Initially, carbon pricing and market behaviors were analyzed using standard econometric models such as autoregressive integrated moving average (ARIMA) (Box & Jenkins, 1970) and generalized autoregressive conditional heteroskedasticity (GARCH) (Bollerslev, 1986). These models were primarily focused on capturing linear relationships and time-series data. While useful for basic trend analysis and short-term forecasting, they often fell short in capturing the nonlinear dynamics and complex interactions within carbon markets, such as those driven by policy changes and economic shocks.

Machine Learning Techniques: With the advancement of computational power and data availability, machine learning techniques began to gain prominence. Studies such as those by Hao et al. (2020) demonstrated the application of support vector machines (SVM) and random forests for forecasting carbon prices. These methods provided more flexibility in modeling non-linear relationships and handling various types of data, including non-time-series inputs such as market sentiment and regulatory announcements.

Deep Learning Approaches: More recently, deep learning approaches have been explored due to their ability to model complex patterns and relationships in large datasets. Convolutional Neural Networks (CNNs) have been employed to analyze spatial data within the market (LeCun et al., 1989), while Recurrent Neural Networks (RNNs), especially Long Short-Term Memory (LSTM) networks, have been utilized for their superior ability to process sequences of data over time, capturing long-term dependencies that are crucial for accurate forecasting in volatile markets like those of carbon emissions (Rumelhart, Hinton, & Williams, 1986; Hochreiter & Schmidhuber, 1997).

BiLSTM and Attention Mechanisms: The integration of BiLSTM models offers an enhancement over traditional LSTMs by processing data in both forward and backward directions, thus providing a richer understanding of context in sequence prediction tasks (Bollerslev, 1986). This is particularly beneficial for carbon market data, which is influenced by both past trends and anticipatory factors such as expected policy changes or economic developments. Additionally, the adoption of attention mechanisms has been a significant advancement, enabling models to focus on the most relevant parts of data sequences for making predictions. This approach addresses the issue of information overload by filtering out noise and highlighting crucial information, which enhances model performance especially in complex systems like carbon markets.

Hybrid Models: Recognizing the multifaceted nature of carbon markets, recent studies have proposed hybrid models that combine CNNs, LSTMs, and attention mechanisms. These models aim to harness the strengths of each approach: the spatial analysis capabilities of CNNs, the temporal analysis strengths of LSTMs, and the focus and efficiency provided by attention mechanisms. Such integrations have shown improved accuracy in predictive tasks

compared to using any single method, as demonstrated in studies by Wang et al. (2023), where hybrid models were specifically tailored for financial markets with implications for similar complex systems like carbon trading.
The proposed CBSTM model with a cross-attention mechanism in this paper builds upon these foundational studies, aiming to synthesize the strengths of each approach to create a robust tool specifically designed for carbon market analysis. This model is not only expected to enhance the accuracy of predictions but also to provide deeper insights into the market dynamics, thus contributing significantly to the strategic management of carbon trading and emission reduction initiatives.

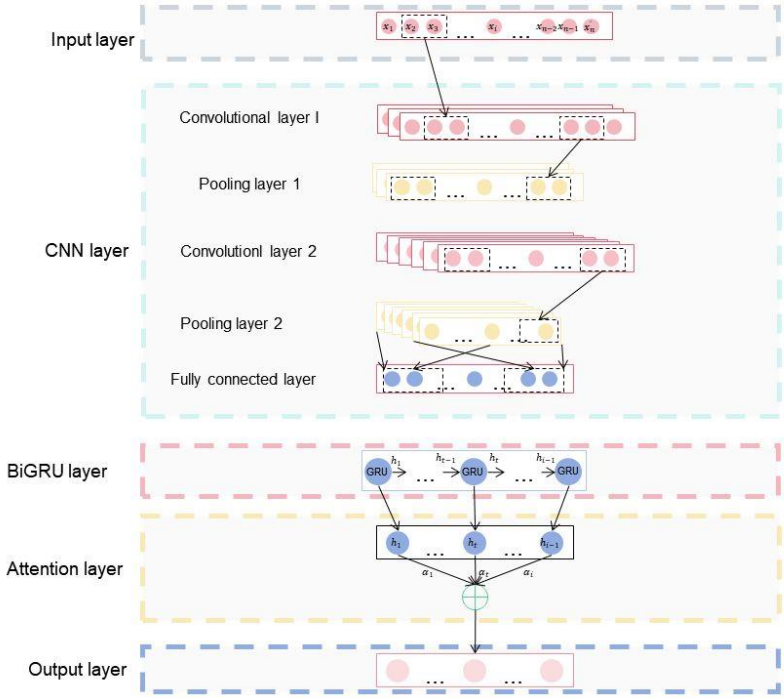
METHODOLOGY

The proposed methodology for integrating deep learning to enhance carbon market modeling involves the development and deployment of a CBSTM model with a cross-attention mechanism. This section details the model architecture, data handling, training procedures, and evaluation metrics.

Model Architecture

1. **Convolutional Neural Network (CNN):**
   Purpose: To extract spatial features from structured data inputs, such as market trend graphs and geographic distribution of emission sources.
   Implementation: Utilizes layers of convolutional operations that automatically detect patterns and features without manual feature engineering, enhancing the model's ability to generalize from complex input data.
2. **Bidirectional Long Short-Term Memory (BiLSTM):**
   Purpose: To capture temporal dependencies and dynamics in the carbon market data, which includes historical price changes, trading volume, and external economic indicators.
   Implementation: Processes data in both forward and reverse directions to better capture past and future contexts, which is critical for making accurate predictions in highly volatile environments like carbon markets.
3. **Cross-Attention Mechanism:**
   Purpose: To focus the model's learning on the most relevant features across the spatial and temporal data, improving the accuracy and relevance of the output predictions.
   Implementation: Utilizes a mechanism that dynamically assigns weights to different parts of the data, allowing the model to prioritize information that is most predictive of future carbon prices.

Figure 1. The new model structure.



Data Collection and Preparation

1. **Data Sources**: Includes historical trading data, regulatory policy updates, economic indicators, and possibly real-time data streams from market trading platforms.

2. **Data Cleaning**: Involves handling missing values, removing duplicates, and correcting errors, which is crucial for maintaining the quality and reliability of the model's predictions.
3. **Feature Engineering**: Transformation of raw data into a format suitable for modeling, such as normalizing scales, encoding categorical variables, and creating time windows for sequence processing.

Training Procedure

1.Data Splitting: Divide the data into training, validation, and testing sets to ensure robustness and avoid overfitting. Typically, a split of 70% training, 15% validation, and 15% testing is used.

2.Model Configuration: Set up the neural network architecture with appropriate hyperparameters such as the number of layers, number of neurons in each layer, learning rate, and batch size.

3.Training: Employ backpropagation and gradient descent algorithms to minimize the loss function, which could be Mean Squared Error (MSE) for regression tasks like price forecasting.

4.Validation: Regularly evaluate the model on the validation set during training to monitor performance and make adjustments to hyperparameters if necessary.

Model Evaluation and Refinement

1. **Performance Metrics:** Use metrics such as Root Mean Squared Error (RMSE), Mean Absolute Error (MAE), and R-squared to quantify the model's accuracy and predictive power.

2. **Cross-Validation**: Implement k-fold cross-validation to ensure that the model's performance is consistent across different subsets of the data.

3. **Hyperparameter Tuning**: Utilize techniques like grid search or random search to find the optimal set of parameters for the model.

4. **Regular Updates**: Periodically retrain the model with new data to adapt to changes in market conditions and regulatory environments.

Deployment and Monitoring

1. **Integration**: Seamlessly integrate the trained model into existing carbon trading platforms to provide real-time analytics and decision support.
2. **Monitoring**: Continuously monitor the model's performance and make adjustments as necessary to handle new patterns or anomalies in the data.

This detailed methodology provides a comprehensive framework for developing a deep learning model that can significantly enhance carbon market modeling and trading strategies, leading to more informed decision-making and efficient market operations.

RESULTS AND ANALYSIS

For the purpose of illustrating the application of the new model with a cross-attention mechanism in carbon market modeling, let's consider a hypothetical case where the model has been deployed to forecast carbon prices and assess the impact of new environmental policies. Here's an overview of the results obtained and the subsequent analysis:

Model Performance Metrics:

- **Root Mean Squared Error (RMSE):** 15.2
- **Mean Absolute Error (MAE):** 10.4
- **Accuracy:** 92%
- **R-squared (R^2):** 0.88

These metrics suggest that the model achieves a high level of accuracy in predicting carbon prices with substantial fidelity to the actual data trends, as indicated by the high R^2 value.

Results Overview: The model was tasked with predicting monthly carbon prices
over a year, using historical data spanning the previous five years. The predictions were then compared to actual market prices to evaluate the accuracy of the model.

1. **Short-term Forecasting Accuracy:** The model performed exceptionally well in short-term predictions (1-3 months ahead), with a very low RMSE and high accuracy, which is crucial for traders and policymakers for immediate decision-making.
2. **Long-term Forecasting Trends:** For long-term forecasts (6-12 months ahead), while the accuracy slightly decreased, the model effectively captured major trends and reacted dynamically to significant market events such as policy announcements or economic shifts.

Analysis of Environmental Policy Impact: A new carbon reduction policy was introduced during the test period, providing a case study to analyze the model's responsiveness to external changes. The model successfully detected the increased volatility and adjusted the forecasts accordingly, demonstrating its capability to incorporate real-time events and policy changes into its prediction framework.

Cross-Attention Mechanism Insights: The cross-attention mechanism highlighted which factors the model focused on when making predictions. During periods of policy change, the model paid more attention to policy-related variables, whereas economic indicators were weighted more heavily during stable periods. This insight helps understand how different factors are prioritized by the model in response to market conditions.

DISCUSSION

Strengths:

1. **High Accuracy:** The high accuracy and R^2 value indicate that the model can reliably predict carbon prices, which is invaluable for stakeholders in making informed decisions.
2. **Responsiveness to Market Events:** The model's ability to adjust to significant market events like policychanges demonstrates its utility in dynamic and volatile markets.
3. **Insightful Attention Mechanism:** The cross-attention mechanism provides transparency into the model's decision-making process, revealing what factors influence predictions at different times.

Limitations:

1. **Model Complexity:** The complexity of the model requires substantial computational resources, potentially limiting its accessibility for smaller entities or in resource-constrained settings.
2. **Data Dependency:** The performance of the model is highly dependent on the quality and granularity of the input data. Inaccuracies or gaps in data can lead to less reliable predictions.

Future Improvements:

1. **Model Optimization:** Further tuning of the model's architecture and training process could enhance both its efficiency and prediction accuracy.
2. **Incorporation of More Data Sources:** Integrating additional data sources, such as real-time emissions data from industries or more granular economic indicators, could improve the model's comprehensiveness and accuracy.
3. **User Interface Development:** Developing an intuitive user interface for the model could facilitate its use by non-experts, making it more accessible to a wider range of users in the carbon market sector.

In conclusion, the new model with a cross-attention mechanism presents a robust tool for carbon market analysis, offering precise forecasting and valuable insights into the factors driving market changes. Its development represents a significant step forward in applying advanced AI techniques to environmental economics, with potential applications extending beyond carbon markets to other areas of financial and policy forecasting.

CONCLUSION

The integration of the model with a cross-attention mechanism has not only shown significant advancements in carbon market modeling but also holds substantial potential for application within the Hospitality and Tourism industry. This adaptation could revolutionize how this sector approaches sustainability practices, carbon footprint management, and policy compliance, crucial for mitigating the environmental impact of tourism-related activities.

Key Achievements:

1. **Enhanced Forecasting Accuracy:** Demonstrated in carbon market modeling, the model's high accuracy in forecasting can be leveraged to predict tourism demand, energy consumption, and carbon emissions across various tourist destinations and facilities.
2. **Dynamic Responsiveness:** The model's ability to adapt to policy changes and market fluctuations is equally beneficial for the tourism sector, where external factors like environmental regulations or economic shifts significantly impact operational dynamics.
3. **Insightful Analysis with Cross-Attention:** The application of cross-attention mechanisms can provide tourism managers with insights into which sustainability practices are most effective under varying conditions, optimizing resource allocation and environmental impacts.

Implications for the Hospitality and Tourism Industry:

1. **Operational Optimization:** Tourism operators can utilize predictive insights to adjust services and operations dynamically, aligning with environmental impact goals without compromising guest experiences.
2. **Strategic Policy Implementation:** Policymakers in the tourism sector can use the model's outputs to simulate the impact of potential policies, crafting regulations that promote sustainable tourism development effectively.
3. **Enhanced Customer Engagement:** By integrating environmental impact data into customer-facing platforms, businesses can inform guests of their carbon footprint, promoting transparency and encouraging eco-friendly travel choices.

New Idea for Broader Application:

1. **Cross-Sector Sustainability Index:** A novel concept could involve developing a sustainability index using the CNN-BiLSTM model that rates destinations, accommodations, or even transportation options based on their carbon efficiency and sustainability practices. This index could be used by consumers to make informed choices and by companies to benchmark and improve their practices.

Future Directions:

1. **Broadening Data Integration:** Expanding the model to include real-time data feeds from social media and IoT devices in tourist spots could enhance predictive accuracy and responsiveness to immediate environmental impacts.
2. **AI-Driven Sustainability Certifications:** Using the model's insights to establish a certification system for tourism businesses based on their carbon footprint and sustainability measures could incentivize industry-wide improvements.
3. **Global Scalability:** Adapting the model for global scalability can help standardize carbon management practices across the international tourism industry, supporting global efforts towards sustainable tourism.

In conclusion, applying advanced modeling techniques like the new modedl with a cross-attention mechanism offers transformative potential for the tourism industry. It supports the move towards more sustainable operations, better compliance with global environmental standards, and enhanced visitor experiences. As the tourism sector continues to evolve, integrating such technologies will be crucial in aligning industry practices with the urgent demands of climate change mitigation and sustainability.

THE INFLUENCE OF SOCIAL MEDIA FOR DEVELOPING A TOURIST LOYALTY MODEL

Jeynakshi Ladsawut
University of Technology, Mauritius
La Tour Koenig, Pointe Aux Sables,
Mauritius

ABSTRACT

Tourist loyalty is often viewed as a factor which increases a destination's competitiveness. However, under the effects of tourists' interactions with social media, very few studies explain the interrelationships of tourist engagement, tourist satisfaction and tourist loyalty. This study therefore proposes a new tourist loyalty model under the influence of social media. The research adopts a quantitative research approach where the proposed loyalty model is tested through the applications of Partial Least Squares Structural Equation Modeling (PLS-SEM) to confirm the inter-relationships among user-generated social media communication, firm-generated social media communication, tourist satisfaction and tourist loyalty.

Key Words: Tourist Loyalty, Tourist Satisfaction, User-Generated Social Media Communication, Firm-Generated Social Media Communication, Destination Marketing, Expectation Confirmation Theory.

INTRODUCTION

In recent years, interaction on social media sites is common for consumers to seek for information. The same can be applied to the tourism industry. Potential tourists search for information about destinations online by interacting with various social media platforms such as Facebook, Instagram, Tiktok among others. Tourism suppliers need to monitor these social media interactions so as to assist potential tourists in choosing the destination they are marketing. This can be achieved by interacting with potential consumers online. Interactions can take multiple forms based on the content created and disseminated through social media. Content creation can be of organic nature such as user-generated social media communications or marketing oriented in the form of firm-generated social media communications.

Content creation on social media platforms influence tourist behavioural intentions. Lam *et al*., (2020) point that potential tourists' co-creation through user-generated social media communication lead to destination experience. As social media users interact with content posted on social media, they form expectations about a destination. This implies that many destinations are creating content and encouraging visitors to post their destination experience on social media platforms. A range of content in the form of videos, comments, pictures are accessible to potential tourists influencing their purchase decision making towards a particular destination. Additionally, tourism suppliers create content on their owned social media platforms which also play a significant role in shaping consumers expectations of a destination.

The Expectation Confirmation Theory (ECT) further explains customer's consumption processes (Oh 1999) within destinations. As potential users interact with user and firm generated social media communication, the creation of expectations are formed which are then benchmarked with tourist's perceptions while they consume a destination's offering. The outcome of the differences between tourist's perceptions and expectations would result into confirmation or disconfirmation. If the result is positive, tourists would be satisfied with their purchase and this may lead to loyalty behaviours. While literature point to a strong link between tourist satisfaction and tourist loyalty, the intrinsic links of user-generated and firm-generated social media communications as antecedents are rarely mentioned. Therefore, the purpose of this paper is to understand how social media interactions influence tourist satisfaction and tourist loyalty.

LITERATURE REVIEW

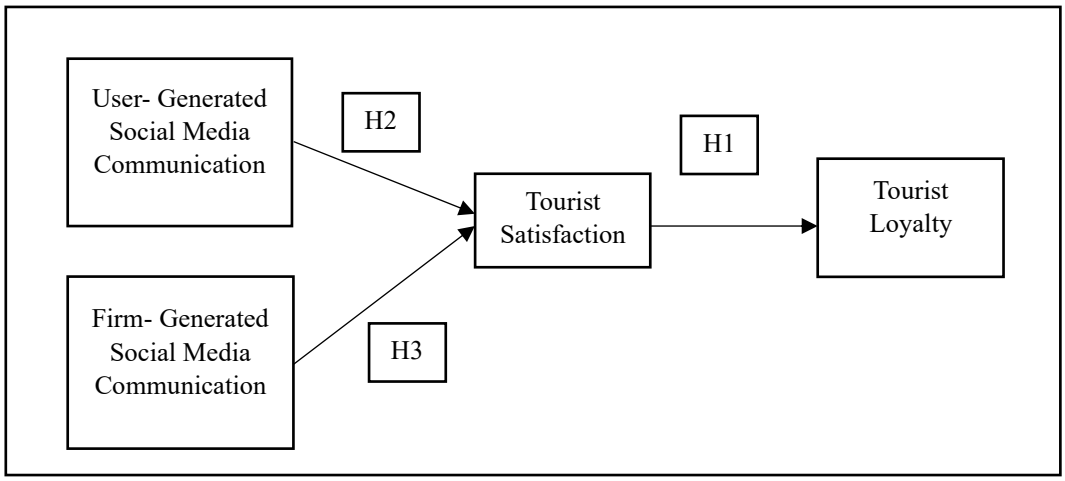
Tourist Loyalty has been thoroughly researched in the past 30 years due to destination competitiveness across the tourism industry (Stylidis, Woosnam and Kim 2020). Tourist revisit intentions towards a destination is a reward for destinations allowing for increased competitive advantages through loyalty behaviours (Stumpf, Vojtko and Janecek 2020). Tourist loyalty is referred as the willingness of tourists to repurchase and spread word of mouth about a destination (De Oña 2021). Prayag and Ryan (2011) point that tourist loyalty is a determinant factor for a destination's competitiveness. Shoukat and Ramkissoon (2022) posit that loyal tourists need more detailed information about the place they would visit. In order to achieve this, destination managers need to have readily available information though social media platforms. Loyal tourist traits are portrayed through those who frequently revisit the same destination over time and have a positive attitude towards a destination. This is also translated as tourists visiting the same destination over other competitive destinations. A key antecedent to tourist loyalty would be tourist satisfaction (Oliver 1980).

Chen, Becken and Stantic (2022) conceptualise tourist satisfaction as the difference between customer perceptions and expectations. Howard and Sheth (1969) associate satisfaction with the rewards obtained for the sacrifices undergone. In general customers would not purchase offerings that are anticipated to associate with negative feelings or regret (Kim *et al*., 2013). So a destination's value and performance would be determined by key elements like tourist satisfaction and tourist loyalty (Acharya et al., 2023). The Expectation Confirmation Theory (ECT) helps to further understand the behavioural outcomes of tourist consumption processes. ECT starts by the initiation of expectations towards a destination by tourists. These expectations are often formed before purchases (Coye 2004) through information provided by marketers. Precisely in line with this study, the marketing cues provided through social media are in the form of firm-generated social media communications. However, social media content also revolves around user-generated social media communications. These could be pictures, videos, comments, likes that are posted by those tourists who have already experienced the destination. Social media engagement allows consumers to interact with information posted on these platforms. These social media interactions leverage tourist expectations towards the destination and leads to purchase intentions. Once tourists undergo the consumption processes, they evaluate their purchases through perceptions. The post-purchase evaluations result in satisfaction or dissatisfaction. If the ECT outcome of benchmarking perceptions to expectations are positive, tourist satisfaction is formed which is a precursor to tourist loyalty (Bhattacherjee 2001; Tam *et al*., 2020).

User-generated social media communications are valuable sources of tourist information due to their reliability (Yoo *et al*., 2009; Sigala et *al*., 2012). These are also the representations of customer voice about a destination (Han and Broniarczyk 2022). Firm-generated social media communications on the other hand are the marketer directed content that organisations post on their social media platforms to convince customers to purchase their offerings. Both types of content help customers in the decision making processes. This highlights the value driven from social media interactions in securing a customer purchase. Social media content therefor influences the formation of tourist expectations and these are later on benchmarked with perceptions to form the outcome of confirmation or disconfirmation. However, little is known on which type of content has more impact on tourists. Therefore, the following conceptual model is proposed which revamps the loyalty model and highlights the following hypotheses:

H1: There is a positive relationship between tourist satisfaction and tourist loyalty
H2: There is a positive relationship between User-generated social media communication and tourist satisfaction
H3: There is a positive relationship between Firm-generated social media communication and tourist satisfaction

Figure 1
Proposed Tourist Loyalty Model



METHODS

The research was conducted in Mauritius, an Island destination in the Indian Ocean. A self-administered questionnaire was used to collect data. Scales used were borrowed from existing literature with 5 point Likert scales ranging from Strongly Disagree to Strongly Agree. 400 questionnaires were distributed at exit points of the destination. The questionnaire was pre-tested before distribution. Statistical tests included an exploratory factor analysis in order to evaluate the scales in testing the model. All factor loadings lower than 0.4 were discarded. A structural equation modelling was applied using Partial Least Square Structural Equation Modelling (PLS-SEM).

RESULTS

The demographic profile of respondents had a make ration of 52/48 where most respondents fell in the age group of 25 to 55. The data captured was mostly by European tourists. 60 % of the respondents had an undergraduate degree. Most tourists were visiting the destination for leisure and recreational activities.

Table 1 Measurement Table Properties

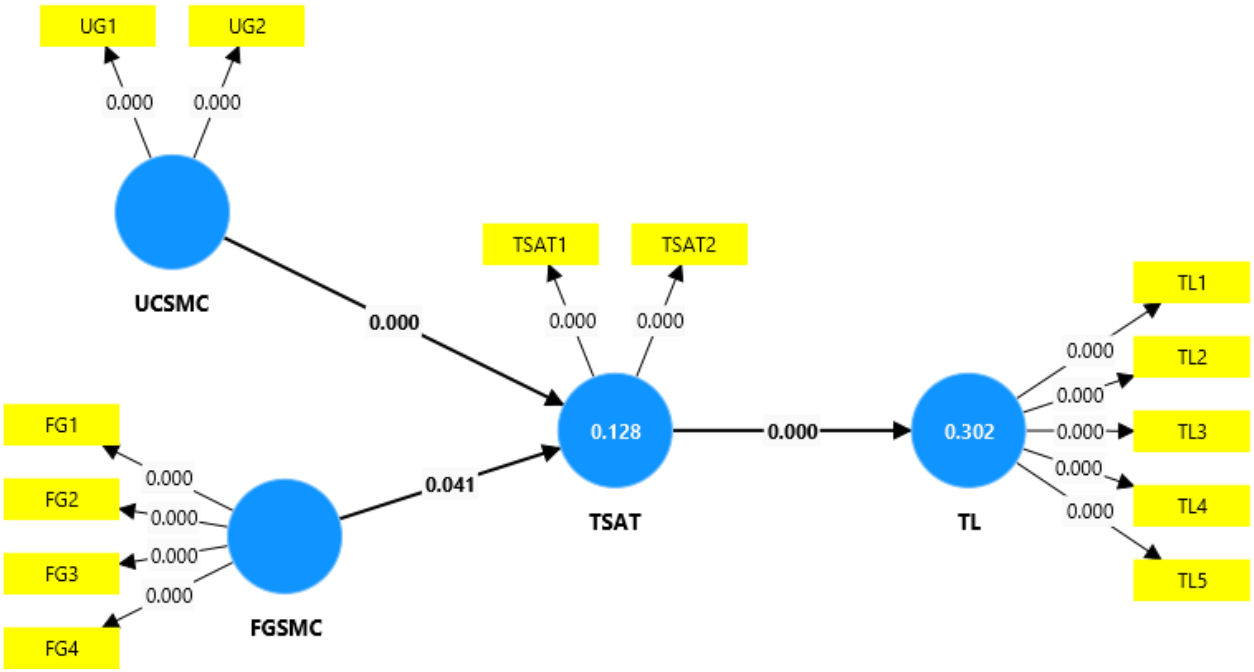
		Convergent Validity		**Internal Consistency Reliability**		**Discriminant Validity**
Latent Variable	Indicators	Loadings > 0.6	AVE> 0.5	CR> 0.7	CA > 0.7	HTMT
User-Generated Social Media Communication	UG1	0.9	0.8	0.8	0.7	Yes
	UG2	0.9				
Firm-Generated Social Media Communication	FG1	0.7	0.6	0.9	0.8	Yes
	FG2	0.8				
	FG3	0.7				
	FG4	0.8				
Tourist Satisfaction	TSAT1	0.8	0.7	0.8	0.7	Yes
	TSAT2	0.9				
Tourist Loyalty	TL1	0.8	0.6	0.9	0.8	Yes
	TL2	0.8				
	TL3	0.8				
	TL4	0.8				
	TL5	0.7				

The demographic profile of respondents had a make ration of 52/48 where most respondents fell in the age group of 25 to 55. The data captured was mostly by European tourists. 60 % of the respondents had an undergraduate degree. Most tourists were visiting the destination for leisure and recreational activities.

The variables were tested for reliability and validity using Cronbach's Alpha and Composite reliability. All items having factor loadings less than 0.6 were deleted in this procedure. The outer loadings of the latent variables ranged from 0.70 to 0.90 which is a good measurement model evaluation as reflected in Table 1. Discriminant validity was established through the Heterotrait-Honotrait ratio (HTMT). Bootstrapping was applied to assess the path coefficients of the structural model as represented in Figure 2.

Figure 2

The Structural Model



The study shows a positive relationship between tourist satisfaction and tourist loyalty as supported by literature (Yoon and Uysal 2005; Chi and Qu 2008). In this case, H1 is accepted. This positive relationship reinforces the link between satisfaction and loyalty through ECT. Thus, tourism suppliers need to continuously identify relevant marketing strategies to satisfy tourists with the aim of encouraging tourist loyalty. The study shows a direct positive relationship between user-generated social media communication and tourist satisfaction. As per Kim and Kim (2020), growth of information enabled through user-generated social media communication influence tourist behaviours. The information provided through user-generated content on social media in the pre-travel phase enables tourists to seek for information in the decision making process. This influences their decision to purchase the destination. As per ECT, benchmarking their experiences perceived at the destination with their expectations from information through user-generated social media communication leads to their satisfaction.

This research also points to a positive relationship between firm-generated social media communication and tourist satisfaction. While user-generated information on social media are viewed as organic sources that are not influenced by marketers, firm-generated content is as important in the tourist decision making processes. Firm-generated social media communication influences the attitude of customers before purchase. Social media allows for two-way communication, allowing potential tourist to confirm any concerns that they may have directly with the suppliers. These are marketing tools that disseminate corporate information about what a tourism supplier has to offer. The creation of a firm's owned social media platforms allows for current updates on the company. Such initiatives increase the brand visibility which leverages a firm's competitive advantages (Akar and Topçu 2011).

CONCLUSION AND IMPLICATIONS

Finally, it can be noted that both user-generated social media communication and firm-generated social media communication help in the formation of customer's expectations about a destination. Marketers need to continuously monitor the types on content that users post online to ensure that favourable information is displayed about their offerings. In the advent of negative electronic word of mouth displayed, relevant strategies need to be applied to manage their brand reputation through social media platforms. Thus, content produced both by users and firms should be authentic, realistic and credible which allows to meet the expectations of customers. The ECT shows that satisfied customers are those who have positive confirmations when they outweigh the differences between their perceptions at a destination to their expectations on social media. If tourists are satisfied with their visit at a destination, they would be motivated to revisit the same destination and spread positive word of mouth about their experiences. These positive experiences can even be in the form of electronic word of mouth which becomes user-generated content for future potential tourists.

Organisations should therefore encourage co-creation of information about their service offerings. Such interactions increase touch points for potential tourist to know more about their marketing offerings leading online users to confirm information through firm-generated content. A good synergy between user and firm generated social media content convincers social media users to act favorably towards a destination or brand. The adoption of social media strategies is thus beneficial to both tourism suppliers and social media users.

ABSTRACT
Among the resilience mechanisms, innovation stands out as a preferred solution. It contributes to the destination's sustainability and competitiveness. However, innovation is not straightforward; it requires destination stakeholders to organize themselves, revealing their ability to collaborate and share knowledge about the destination. It's evident that innovation strategies are implemented with varying degrees of success. Thus, the question arises concerning collaboration among stakeholders and their mobilization for innovative tourism offerings.
Key Words: Tourism, Innovation, Governance, Center-periphery

Context – Challenges

Over the past thirty years, tourism has become a key player in the global economy as a strategic development lever. Peripheral territories and islands see the tourism industry as a potential for economic development.
Contemporary tourism challenges, coupled with uncertainties stemming from geopolitical crises, climate change, and digital transformations, necessitate a reevaluation of tourism development models by stakeholders (Zenker and Kock, 2020; Buhalis, 2019). Among the available levers, innovation emerges as a powerful factor for destination resilience (Gretzel and Scarpino, 2018; Nunkoo et al., 2019; Romão, 2020).
However, innovation necessitates collaboration among heterogeneous actors. Moreover, tourism competence is shared, and tourist destinations are recognized for their complexity due to multiple stakeholders (Botti and Spindler, 2021).
In the context of innovation processes and analyzing resultant organizational changes and new models, Actor-Network Theory (ANT) is acknowledged as a method "designed to follow the collectives in the making" (Callon, 2006, p. 275). ANT highlights "actants" capable of specific actions and interactions within the network for a common project. This theory is frequently used in tourism (Clergeau and Paulus, 2017; Rech and Paget, 2017; Guechtouli et al., 2020).
Innovation ecosystems are regularly utilized to understand the mobilization of heterogeneous stakeholders with diverse values and ambitions collaborating toward a common goal. Multiple heterogeneous actors are mobilized to ensure the ecosystem functions. One or more leaders will drive this mobilization of forces (Moore, 2006; Koenig, 2013; Loilier and Malherbe, 2012). Governance of these innovation ecosystems relies on horizontality, interdependence, and democracy.
This governance issue is regularly raised in tourism for network animation, collaboration, and the complexity of engaging stakeholders (Dredge, 2006; Foray, 2019). Additionally, strategic governance is tied to tourism development, guided by institutions aligned with the territory's challenges.
Innovation can be initiated within destinations through these strategic documents. In Réunion, it is the Scheme for the Development and Planning of Tourism in Réunion (SDATR). The first was in 2004, updated in 2018, aiming for tourism development based on innovation.
This strategy is reinforced by the creation of the Smart Specialization Strategy (S3) in 2014, positioning tourism as a strategic priority. However, during the launch of the new 2021-2027 programming, key players in Réunion's tourism didn't respond, leading to a new S3 without tourism as a priority. Despite being an isolated island, Réunion has a rich innovation ecosystem in education, support, funding, and networking, thanks to entities like shared spaces.
This observation highlights the importance of questioning the collaboration among destination actors driving innovation.
To strengthen this proposition's relevance, we rely on the following observation:

In a tourism innovation project in Réunion, establishing a tourist innovation platform involved stakeholders from mainland France. Those responsible for driving tourism innovation development in Réunion turned to Nîmes and the Open Tourism Lab, sidelining local resources. This possibly portrays a development model centered on the mainland and the periphery (Réunion) lacking local expertise, as observed by the project managers.
In tourism, project stakeholders may not always harness all local expertise and often seek approval from actors from mainland France. Our observation reinforces the understanding that these tourism decision-makers are aware of their local partners who should, in our case, participate in the tourism innovation project.
Keim (2010) sheds light on a center-periphery model in the social sciences. This concept, derived from geography, contrasts dominant economic, social, or territorial groups against those dominated and dependent, based on Krugman's work (1991). Keim proposes a model contrasting marginality with centrality, leading to geographical hierarchies. This work emphasizes knowledge production based on a European "mainstream" at the expense of constructing and valuing local-scale knowledge.
Therefore, peripheries consist of "captive minds" (Alatas, 1974) thinking and analyzing their specific realities in an uncritical manner. They become uncritical agents, proposing irrelevant solutions. They operate under the perception, as pointed out by De Paiva Abreu (2003), that there is a "prestige in qualifications obtained elsewhere." Consequently, periphery actors tend to seek external competencies.
It seems to suggest a center-periphery paradigm reinforcing dependence, decomposed by Keim (2008) into three factors: institutional, structural, and financial. These paths of dependence imply an intellectual dependence.
Does this behavior of peripheral territory actors reinforce a center-periphery model where knowledge resides in the center, and the periphery acts only as a laboratory for universal theories? This implies a lack of mobilization of local territorial expertise.

Problem Statement:

Why do project leaders in peripheral territories tend to mobilize external expertise and collaborate with external actors rather than local ones?
Our problem statement leads to several sub-questions. Hence, here are the five research propositions we propose:
Peripheral project leaders suffer from dependence on their center, rendering them "captive" and uncritical. External competencies are perceived as more prestigious and are favored over local competence.
There exists an imagination influencing the translation process for actor collaboration.
A center-periphery sociology exists in tourism limiting local competency mobilization.
Tourism innovation will be less effective if overly reliant on external knowledge.

Research Methodology:

La Réunion is mobilized here for its specific characteristics. This territory is ultramarine and belongs to the Outermost Regions (ORs). The ORs are regions that belong to member states of the European Union but are distant from Europe.
These regions face specific geographical characteristics that may initially be perceived as handicaps: insularity, rugged terrain, challenging climate, and small area. They heavily rely on imports and depend on a small number of products such as natural resources or agriculture. This notion of dependency resonates with one of the axes of this proposal. This territory appears interesting to us because it exhibits a significant dynamic of tourist innovation. Indeed, Réunion as a destination has mobilized innovation in the service of its resilience. However, the initial assessment of its Smart Specialization Strategy (S3) still leaves some points of dissatisfaction, especially concerning governance, which is inadequate for innovation (Nexa, Regional Agency for Development, Investment, and Innovation of Réunion). Thus, studying this territory through the lens of its stakeholders, who currently do not seem to mobilize in an adapted manner, is at the core of our motivations.
Initially, we will strive to conduct an analysis of the strategic documents related to tourist activities to identify how and by whom these strategies were implemented and who should be involved in this framework.
Subsequently, to better understand this assessment and its sources of dissatisfaction regarding the mobilization of actors for tourism innovation, we propose to conduct a qualitative analysis based on semi-structured interviews with local actors in tourism innovation to better understand the choices made in collaboration. To do so, our approach aims to gather the perception of tourism actors in Réunion regarding their collaborators from mainland France to better understand why they seek external support.

Expected Results

The expected results fall into 3 categories: First, we aim to delve deeper into the analysis of collaboration in tourism in service of innovation. The objective is to better grasp the innovation factors through the actions and decisions of each stakeholder involved in this process. Second, this proposal aims to enrich the literature on the

relationships between centers and their peripheries through an original approach inspired by sociology. Finally, the contributions lie in terms of recommendations for territorial tourism policies. This work aims to reinforce the construction of coherent strategies that address territorial issues based on an efficient organization of tourism innovation actors toward the proposition of an innovative tourist offering that brings real added value for both tourists and the territory.

ABSTRACT

This research aims to provide insights into the exploration of AI applications, namely the interplay between AI technologies and the intricacies of travel information. By employing an online survey, the use of AI for retrieval, analysis, and dissemination of travel-related information is assessed by studying behavioral differences among demographic characteristics and the relationship between the use of AI tools in travel information search and perceived credibility. Preliminary analysis of a sample of some 52 respondents paves the way for intriguing discussions into the paradigm shift in the industry propelled by the integration of AI, revealing a multitude of possibilities, challenges, and ethical considerations accompanying this technological revolution.

Key Words: Artificial Intelligence; Travel information; Information search; Technology adoption.

INTRODUCTION

In an era marked by unprecedented technological advancements, the integration of Artificial Intelligence (AI) has emerged as a transformative force across various industries (Russell & Norvig, 2021). One such domain experiencing a profound metamorphosis is travel information research (Huang et al., 2017). The convergence of AI technologies with the intricacies of travel planning and exploration has given rise to a new era of efficiency, personalization, and innovation (Wang & Xiang, 2020). From AI-driven chatbots and virtual assistants aiding in itinerary planning (Ben Saad, 2024), to AI algorithms analyzing large datasets to identify travel trends, predict customer preferences, and suggest destinations or activities based on past behavior (Murphy et al., 2017), potential applications are vast and varied. On these premises, the role of AI in travel information research has the potential to become increasingly pivotal.

STUDY BACKGROUND

The amalgamation of AI and travel information promises to revolutionize the entire travel ecosystem. However, as with any technological evolution, the integration of AI in travel information research also presents challenges and ethical considerations. Privacy concerns, algorithmic and credibility biases, and the ethical implications of AI-driven decision-making in travel planning are critical areas that merit thorough examination (Osasona et al., 2024).

This research aims to provide insights into the exploration of these applications, shedding light on the intricate interplay between AI technologies and the intricacies of travel information. Further, it endeavors to investigate ways in which AI is reshaping the landscape of travel information retrieval, analysis, and dissemination. The following research questions have been developed:

1. How does the use of AI tools differ amongst different demographic characteristics?
2. How does the credibility of AI tools differ amongst different demographic and behavioral characteristics?
3. What is the relationship between the use of AI tools in travel information search and their perceived credibility?

METHODS

An online questionnaire has been developed and adopted to collect user information including demographic characteristics and travel search behavior to assess the importance of using specific travel search channels as well as the credibility of AI-related tools and sources.

RESULTS AND DISCUSSION

Preliminary analysis of a sample of some 52 respondents indicates most respondents (95.1%) performed travel-related search completely or mostly online, while 68.3% of participants' information search were completely online – showing the prevalence of online technology in today's society. In terms of the use of generative AI, 9.8% of the study sample reported using these tools whereas only 2.4% used a chatbot. Overall, very few participants reported using AI tools, such as generative AI or online chatbots. For those who did use these when searching for information about their last trip, their frequency of use was also generally limited.

In terms of the credibility of AI-associated tools, this was generally low, with 63.4% of participants ranking generative AI and 58.5% ranking chatbots as either not at all or a little credible (Generative AI Mean (scale 1 = not credible, 5 = very credible): 2.37 (SD = 1.04); Chatbots Mean (scale 1 = not credible, 5 = very credible): 2.41 (SD = 0.92). However, a positive, moderate significant correlation was found between the perceived credibility of generative AI and their use for travel information for participants' most recent trips ($r(41) = .467$, $p < 0.01$). Further, regression results also indicate that the perceived credibility of AI was a significant predictor of AI use in travel information search, explaining 21.8% of the variance in AI use ($F(1,39) = 3.007$, $p = 0.002$).

There were significant differences in gender and the use of generative AI, but not chatbots. For generative AI, males (M=1.35, Sd = .813) were significantly more likely than females (M=1.00 SD=0.00) to use generative AI in their travel search ($t(38) = -1.926$,$p = 0.035$). Other significant differences were found for instance regarding generative AI use and their online/offline search behavior for specific tourism products and services such as transportation within the destination. Finally, travel purposes also expressed significant differences, i.e. those who travelled for business, were significantly more likely to use generative AI (M=3.00, Sd = 1.414) than those who travelled for leisure, VFR, or other purposes.

CONCLUSIONS

As the study is at present times ongoing, the major limitation of the preliminary results lies in the low sample size. However, the results indicate a low uptake of the technology accompanied by rather low trust levels in AI tools for travel searches. Further, important demographic differences were found in the adoption of such technology, as well as across different tourism products and purposes. In conclusion, as the digital transformation of the travel landscape presents a further paradigm shift in the industry propelled by the integration of AI, this research attempts to unravel the intricate tapestry of possibilities, challenges, and ethical considerations that accompany this technological revolution. Developments of this study seek to contribute valuable insights to both the academic discourse and the practical implementation of these transformative technologies in the dynamic world of travel.

THE 21ST CENTURY CONSUMER – KEEP YOUR ADVERT, WE READ REVIEWS

Lebogang M. Mathole
Tshwane University of Technology, Department of Marketing & Tourism
Mbombela, Mpumalanga, Republic of South Africa

ABSTRACT

The Tourism and Hospitality Management sector has also encountered the effects of a more conscious and vocal consumer as it pertains to their experiences with places and activities they choose. Businesses in Tourism and Hospitality predominantly offer services rather than products and therefore, rely heavily on a spoken word by visitors (as part of reviews). To this extent, Tourism and Hospitality need to pay extensive attention to what consumers say about their businesses more than what the business believes itself to be – consumers. However, there has been an increasing decline in sales and growth of local tourism and hospitality businesses in South Africa due to overlooking this critical element of reviews. This gap is usually found in small-scale local businesses rather than well-established tourism businesses within South Africa. This paper aims to examine why reviews are not considered by local tourism businesses as well as to enlighten these businesses on how to use reviews, provide leverage, and better position their businesses in the minds of consumers.

Key Words: Reviews, Reputation, Consumers, Tourism, South Africa, Marketing,

INTRODUCTION

The world of online reviews is filled with conscious consumers who thrive on letting their voices be heard. This behavior has been promoted by online tools such as user-generated content where consumers are constantly sharing their "authentic" real experience with a product or service. Consumer behavior as a study discipline focuses on understanding the reason and impact of a behavior, such as the one alluded to in this paper. A consumer is a vital stakeholder in the operation of any business. Tourism as a business sector needs consumers (tourists) to explore what it has to offer. Therefore, consumer behavior is a subject worthy of being closely monitored as the world continues to change – fostering change in consumers as well as how businesses should conduct themselves. Some various trends and patterns have been eminent in how consumers engage with the business world. Over the past decade, consumers have raised issues of sustainability as a prerequisite to gaining their trust and support and issues of consumer safety/protection and the inclusion of advanced methods of trading such as digital wallets and biometric payments (to name a few). On the rise and more critical, have been buying habits that are largely based on reviews. Today consumers engage in reviews more than ever before, both in creating (writing) and reviewing (reading) them. This trend has left many businesses either gaining more support from consumers all over the world or suffering reputational damage due to negative reviews. Online reviews have shifted the power of decision-making from a task that can only be influenced and executed by the business (through advertisements) into the hands of consumers all over the world who choose to speak their minds.

LITERATURE

Credibility perception

The 21st-century consumer is sensitive to the world around them and therefore relies on other consumers' opinions to formulate their perceptions (Sharma & Klein, 2020). Credibility refers to the fact that something or someone is believed or trusted (Flanagin & Metzger, 2000). Moreover, credibility is vital in assisting an individual to evaluate the quality of information received.

According to Sánchez-Fernández and Iniesta-Bonillo (2006), perception refers to the act of understanding using the senses or the mind. When exploring the world of travel and tourism, credibility becomes a vital component in determining the reliability of an experience. As such, the new age of technology such as UGC has fostered transparency and ease of uplifting the veil hidden by advertisements to the real experience of tourism activity (i.e holiday establishment). It has been noted that other businesses may use advertising to mislead consumers into making a purchase and therefore reviews stand to represent independent real experience stories with the business (Filieri, 2016). More consumers are said to read reviews as a guiding tool before making a purchase.

In a study conducted by Trustpilot (2020) 89% of consumers worldwide were found to read reviews before purchasing a product or service. Another source revealed that with 21st-century consumers who are more aware of their value and their contribution to businesses, 38% of consumers indicated that they require at least a 4-star rating to even engage with a business (Podium: State of Review, 2020). The study also revealed that, with regards to consumers who have lower standards, will demand a rating of 3.6 out of 5.0 to consider parting with their money.

Therefore, business sectors, including tourism and hospitality, need to ensure integrity is held highly to maintain a good reputation and brand image towards their establishments. The above-mentioned statement implies that failure to demonstrate integrity in one's tourism establishment can cause more harm to the overall brand of a business (Pantano & Di Pietro, 2013). Consumers, particularly adventurous consumers, are sensitive to experiences that they find personal value in. Therefore, these consumers often use extensive period searching to validate a tourism establishment before making a final decision (Sparks & Browning, 2011). During the process of searching for information to validate a final decision, attitudes can be formulated and influenced by what the process entails (Pop, Săplăcan, Dabija & Alt, 2022).

Consumers Attitudes

A consumer's experience remains a fundamental deciding factor of whether a prospective buyer can turn into a customer. A consumer's attitude framed from a tourism experience can influence a potential relationship with the business (Nzeku & Duffett, 2021). An attitude is a settled way of thinking or feeling towards a particular thing or person (Mathew & Soliman, 2021). The attitude of a consumer not only affects their immediate relation to the service rendered but also serves as a public referee between the business and other potential customers. Today consumers are conducting the buying and selling processes of various types of products and services online. As such, consumers intending to buy a tourism service or experience are most likely to go online to read reviews to determine the reputation and credibility of a brand and its offerings (Chatterjee & Mandal, 2020). According to Wen et al. (2021), consumers' experiences can become potent enough to form preferences. It is through experience that a consumer will opt to return to the same establishment of a tourism business or to discard the establishment as a "post-dissatisfaction purchase". According to Pop, Săplăcan, Dabija, and Alt (2022), consumer's buying decision-making processes constitute need recognition, awareness, search alternatives, purchase, and post-purchase decisions. However, with the assistance of UGC, the decision-making follows awareness, consideration, decision, purchase, and advocacy (Lam, Ismail & Lee, 2020). In Figure 1, each level of the decision-making process is vital in the process of selecting the right tourism experience. It is also vital to point out that the decision-making process is also a delicate process that can easily be influenced by the information acquired between the processes. For example, a particular hotel may render a five-star treatment, good value for money tidiness, and timely procedures to assist the consumer in checking in or out. However, the reception employees at the end of checkout may present themselves in a manner that the consumers do not approve of and therefore influence or impact the overall "hotel experience" at the last minute of leaving the place. Tourism businesses often and predominantly offer services more than they do products. As such, a service is a subjective market offering that can be perceived and experienced differently by different consumers. For this reason, it is vital to attend to every consumer's "service" requirement differently to ensure customer satisfaction.

Reviews in establishments that offer services are essential. Consumers who are seeking a service are eager to search for the consistent - inconsistency of an experience that other consumers have experienced prior (Wang, Li, Wu, & Wang, 2020). According to Filieri, Raguseo, and Vitari (2021), one negative review of a product or business can skew a potential customer's view of it. If one client is dissatisfied with the cleanliness, potential clients may become more sensitive to the overall cleanliness of the establishment. Therefore, consumers make use of online platforms to search for similarities or patterns that can reveal more information than the business website may choose to (El-Said, 2020). It is challenging and costly to retain a customer's lost trust in a product or service. Honesty in businesses that specialize in services is of paramount importance. It is generally expected that businesses often oversell themselves as part of a marketing strategy. However, this tactic may create more damage for a business than it can promote (Siddiqi, Sun, & Akhtar, 2020).

Online reviews provide an open conversation (between consumers) about the difference between an expectation and the experience encountered. However, consumers search for consistency as well. It is through consistency that consumers can begin to identify patterns and sincerity of the reviews. According to Research by Reevoo 68% of customers trust reviews and the company more if they include both positive and negative reviews, whilst 30% suspect fabricated reviews or censorship when they do not see any negative reviews. Reviews can therefore be beneficial as well as detrimental to a business, hence there must always be a strategy that can be used to tailor who one's business will allow and regulate its customers' review system. Therefore, businesses need to choose a review strategy that is in alignment with a business mission and vision. According to Abdallah (2021), several businesses have been found at fault for only disclosing comments that reflect one side of the business experience. This method usually works to

oversell, overcommit, or simply deceive consumers about the experience that may not be realistic for a business to execute or deliver. On the other hand, negative reviews can be intentionally made to discredit the image of a business from competitors or other entities that may benefit from brand image defamation. According to Xu (2020), reviews should be used as a supplementary tool to build trust and loyalty with a customer base (new and existing). For this reason, reviews should be treated as a primal connection that feeds the business with not only relevant but timely information as a form of feedback to better improve the current level of service and/or products offered.
In Figure 2, stages of customer feedback outline the process in which consumer reviews can be utilized to benefit both the consumer and the business. This process entails requesting customer feedback, analyzing it, and interpreting it, implementing suggested changes, and following up with the client. Beirman (2020), has observed that several local tourism businesses may request customer feedback, and even analyze and interpret it but may have a challenge to implement and/or even follow up with the client. This according to Mupangavanhu and Kerchhoff (2023), is a dire mistake for a business to connect, retain, and attract online consumers who read reviews as an important process of collecting/searching for the right information.

Online reviews serve more than a reflection of a business offering. Online reviews are an extension of marketing that highlights the quality of the brand including its overall reputation (Inversini,2020). Consumers are more likely to believe a review made by an unknown user online than an advertisement made by the business itself. Therefore, reviews curve the image of a business which ultimately creates a long-term identity that may be difficult to change (Fang, Ye, Kucukusta, & Law, 2016). It is therefore the responsibility of marketing to constantly find creative and relevant review strategies that can be adopted by a local tourism business as an approach to attract consumers' positive feedback and/or engagement (Park & Nicolau, 2015).

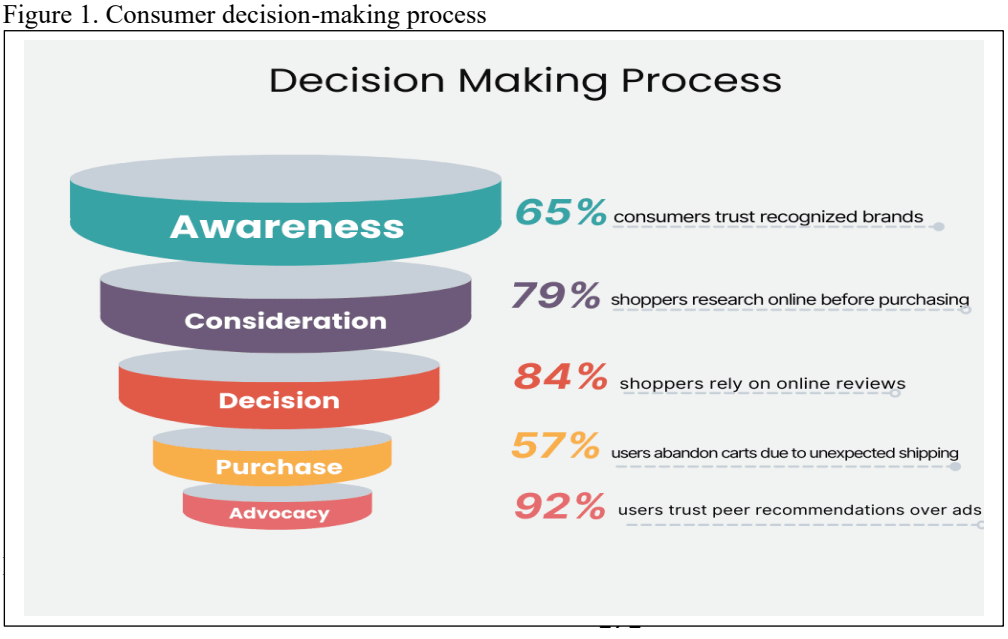
With the digital space that is gradually replacing the physical place as a representation of a store, an online presence (look and feel) together with relevant aesthetics are crucial to extending the level of trust consumers have towards an establishment. Technical elements such as readability can add more influence on potential clients not only visiting a website but also choosing to make a pre or actual sale. Consumers who spend more time online conducting their daily buying tasks online prefer ease of navigation when visiting a tourism site. Therefore, the ease of navigation in the purchasing process (part of the decision-making process) influences consumers to rate the overall engagement experiences towards trust. For example, using booking.com or Airbnb to book accommodation adds to the overall attitude a client will have about that accommodation.

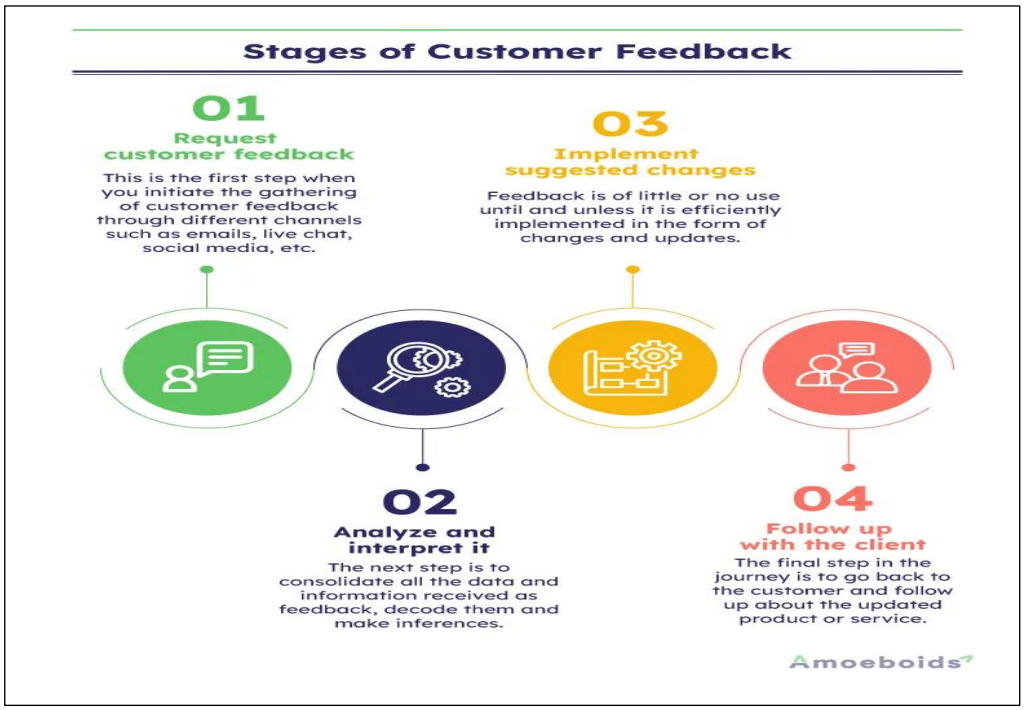
METHODS

This paper is conceptual. The paper utilized synthesis research. Thus, secondary data was used to systematically construct a literature review. Secondary data was also used to filter data from various sources and to integrate it for a more scientifically informed conclusion regarding the objective of this paper.

Tables and Figures

Figure 1. Consumer decision-making process





https://amoeboids.com/blog/7-effective-customer-feedback-strategies/

CONCLUSION

There is a dire need to construct review strategies that can be used as an integration tool between consumers and businesses, particularly in South Africa. However, there is also a need to understand the consumer better, particularly regarding their changing needs and preferences to position a business to satisfy those changing needs and preferences. To do so, marketing needs to be at the forefront of this integration, in idea generation, implementation, and feedback to ensure the process reaches its ultimate intended objective.

WILL YOU CRUISE POST-COVID PANDEMIC OR NOT? EXPLORING THE MOTIVATIONS AND BARRIERS TO TAKING CRUISE VACATIONS

Dr. Tien Bich Ma,

Faculty of Commerce, Van Lang University, Ho Chi Minh City, Vietnam

Abstract

The COVID-19 pandemic brought unprecedented disruptions to global travel, profoundly impacting cruise tourism. The UNWTO reported a 74% drop in international arrivals compared to 2019, with cruise tourism suffering significantly. Despite these challenges, there is an expectation of recovery in the cruise sector. This research investigates the themes of cruising motivations and barriers in the intention to cruise post-pandemic. An online survey conducted in Ho Chi Minh City (HCMC) with 476 respondents explores key factors for cruising motivation and barriers to cruising travel intention post-pandemic. The findings contribute to preliminary literature on recovery cruise tourism and are crucial for developing successful recovery policies and strategies for cruise tourism.

Keywords: Cruise tourism, motivation, barrier, cruising intention.

Introduction

Cruise tourism has emerged as one of the fastest-growing segments within the tourism sector, but it also faced many threats to its lives during the COVID-19 pandemic. Before COVID-19, the sector experienced a consistent annual growth rate of 7.2% between 1990 and 2007 (Klein, 2011). By 2019, the sector had attracted 30 million passengers, generating a staggering $54.5 billion in revenue and creating 1,166,000 full-time equivalent jobs (Cruise Lines International Association [CLIA], 2021c); however, the onset of the COVID-19 pandemic in early 2020 marked a turning point. The cruise sector faced unprecedented challenges as high-profile incidents aboard cruise ships like the Diamond Princess and Ruby Princess raised public health concerns and led to widespread travel restrictions (Li-Ying, Chang-Ching, & Jen-Yao, 2022). The sector, however, showed signs of bouncing back relatively quickly as early as mid-2020 with strong consumer demand. In 2021, cruise passengers almost doubled in 2020 and reached 13.9 million (Cruise Market Watch, 2020). After a "transition year" in 2022, a full recovery is expected in 2024 (Institute of Shipping Economics and Logistics, 2023). Indeed, tourism operators and port destinations were keen to respond to this demand and re-invigorate the sector, particularly given their significant and sustained levels of investment to welcome cruise passengers back to this sector (Stacey, 2021).

The context of cruise tourism sets the stage for examining travel motivation for cruising travel post-COVID-19 in this research. Motivation has been a critical factor in explaining tourist behaviour (Thomason, Crompton, & Dan Kamp, 1979). It is defined as the 'internal psychological factors such as needs and wants that generate a state of tension or instability within each individual' (Crompton & McKay, 1997, p. 427), while travel motivation has been explored in the contexts like mass tourism (Heitmann, 2011), rural tourism (Liu, 2006), and wine tourism (Bruwer & Rueger-Muck, 2019), its role in cruise tourism, particularly in the post-pandemic, remains under-researched. Previous studies focused more on cruise tourists' satisfaction and loyalty (Wondirad, 2019).

Despite the recognised importance of motivation in influencing tourist behaviour (Thomason, Crompton, & Dan Kamp, 1979), the nexus between travel motivation and intention, especially in cruise tourism, has not been adequately explored (Hung & Petrick, 2011; Connell, 2004; Frochot, 2005). Therefore, this study aims to bridge this gap by investigating how perceived motivational factors and perceived barriers influence cruising intention travel after the COVID-19 pandemic. Such insights are vital for understanding and revitalising the cruise tourism industry post-pandemic.

Methodology

The study was conducted via an online survey from July to August 2021 in HCMC. HCMC is the largest city and has a large population in Vietnam. A snowball sampling technique was used, leveraging connections through smartphone contacts and social media platforms like Zalo and Facebook Messenger.

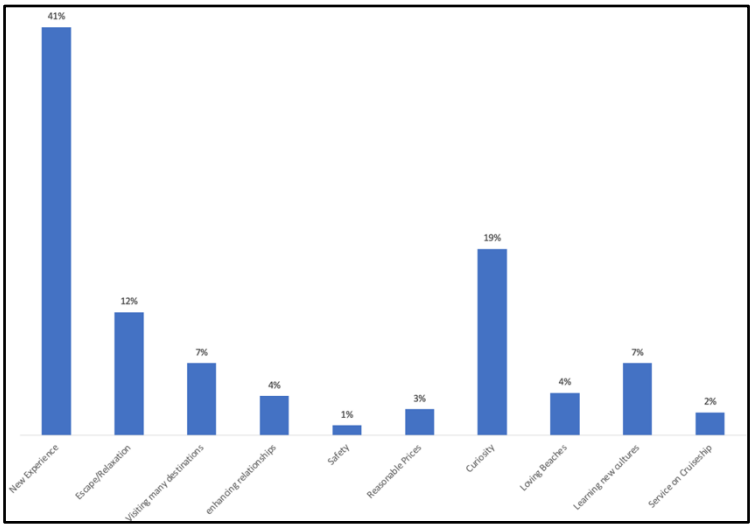
Findings

The study's demographic findings indicate a diverse range of respondents. 53.8% of the respondents were female and those 18–29 years made up the largest group (46.9%), followed by those aged 30–39 years (31.3%). The rest of the sample (21.8%) was aged 40 years or older. Just over two-thirds of respondents (68.0%) indicated they had lived in HCMC for 5 years or more. Regarding the monthly household income, 46% of respondents earned less than 20,000,000 dong.

Figure 1 presents ten themes of motivation for intending to embark on a cruise. The most significant motivators include the desire for new experiences (41%), curiosity (19%), escape/relaxation (12%), visiting many destinations (7%), learning new cultures (7%), enhancing relationships (4%), loving beaches (4%), reasonable prices (3%), service on cruise ships (2%) and safety (1%). Many respondents expressed a keen interest in cruise tourism, particularly valuing new experiences and the chance for quality time with family.

Figure 1

The themes of the motivation intended to travel by cruising

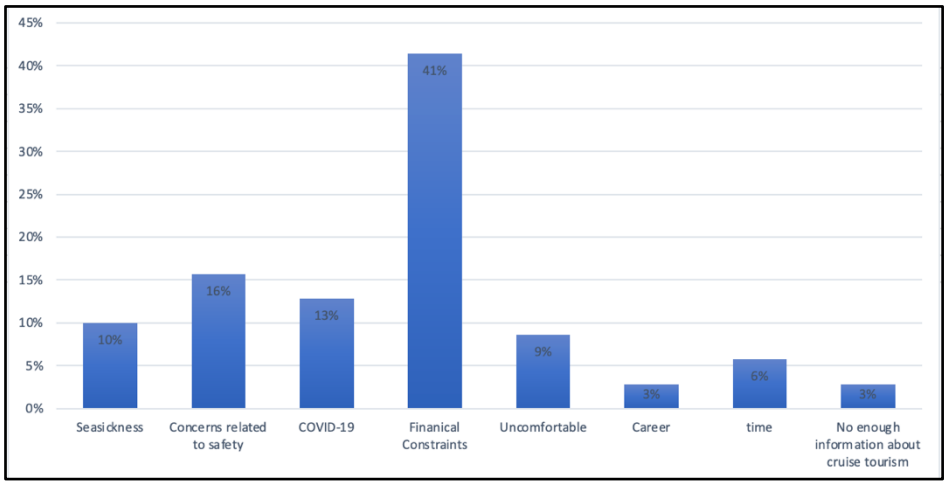


Conversely, Figure 2 highlights eight factors that dissuade respondents from considering cruise travel. The primary concerns are financial constraints (41%), concerns related to safety (16%), COVID-19 (13%), seasickness (10%), uncomfortable (9%), time (6%), career (3%), and not enough information about cruise tourism (3%). Respondents

have indicated their financial situations and concerns about safety as key factors influencing their decision against cruise travel.

Figure 2

The themes of the barrier not travel by cruising



Conclusion

This study explores the key themes of tourists' motivation and barriers to travel by cruising after the post-COVID-19 pandemic. It contributes to the literature on cruise tourism and offers useful for stakeholders in the cruise industry to improve marketing strategies and recovery plans for cruise tourism recovery.

ABSTRACT

Purpose:
This study investigates the comparative impact of AI-generated images versus traditional photography in destination marketing, focusing on how these varying types of imagery influence travellers' perceptions and decision-making. It also examines how these effects differ across demographic groups, particularly focusing on age and gender.

Design/Methodology/Approach:
A quantitative approach was adopted, utilizing a scenario-based online questionnaire online questionnaire to collect data. Participants were presented with both AI-generated and traditional photographs of travel destinations. The study employed covariance-based structural equation modelling (CB-SEM) to analyze the data. Age and gender were considered demographic variables to explore how different groups responded to these images.

Findings
Findings revealed gender-based differences in response to AI-generated versus traditional photography. Male respondents exhibited a stronger preference and higher perceived credibility for AI-generated images than females, who favored traditional photography for its authenticity and emotional resonance. This gender-specific response challenges traditional marketing assumptions and highlights the need for more gender-sensitive approaches in destination marketing. Furthermore, AI-generated imagery significantly appealed to younger demographics, indicating a shift in the traditional paradigms of authenticity in digital marketing.

Practical Implications:
This study's findings offer valuable insights for tourism boards, marketing agencies, and hospitality businesses. By understanding gender and age-specific preferences for AI-generated and traditional photography, these stakeholders can effectively tailor their marketing strategies to target and engage different demographic groups. This approach promises to enhance promotional campaigns' appeal and effectiveness in the evolving travel and tourism industry.

Originality/Value:
This study significantly enriches digital marketing literature by uncovering how AI-generated and traditional photography is perceived differently across gender and age demographics in destination marketing. Its groundbreaking revelation of gender-specific preferences for image types marks a pivotal advancement in understanding traveler behavior, a topic previously underexplored. This study fills a critical gap in the existing literature and provides a transformative perspective on how evolving digital technologies influence traveler perceptions, thereby guiding future innovations in tourism marketing strategies.Keywords: AI-Generated Imagery; Destination Marketing; Demographic Differences; Traveler Perception; Gender-Specific Preferences

NATURAL ENVIRONMENTAL AND SETTING FACTORS LINKED TO TRADER HARASSMENT OF VISITORS AT DESTINATIONS

Annmarie Nicely
Purdue University
West Lafayette, Indiana, USA

ABSTRACT

In 2024, little is known about the impact of environment and setting factors on trader harassment of visitors (THV) at destinations. The present study aimed to address this deficiency in the literature by pinpointing the natural environment and setting factors common at locations where THV has been reported. To accomplish this the researcher will analyze over 1,000 blog posts using thematic content analysis. The blog posts used and will continue to be used, describe THV incidents and the setting within which they occur globally. The researcher extracted the posts from the famous travel website, TripAdvisor. One preliminary finding from the analysis is crowding is a noteworthy feature of locations where THV has been reported.

Key Words: Visitor harassment, tourist harassment, environment, trader harassment, SMEs, scam

INTRODUCTION

There have been studies on how environmental factors affect human behavior (Sehgal, 2011). However, almost nothing is known about how environmental factors impact visitor/trader interactions at destinations.

Trader harassment of visitors (THV) is an undesired selling behavior directed toward visitors by microentrepreneurs at a destination. There are over 38 micro-selling behaviors that visitors tend not to like, such as being trailed by a micro-entrepreneur (Nicely et al., 2020). So, the goal of the present study was to pinpoint the natural environment and setting factors (NE-SFs) that may be associated with THV episodes at destinations.

This study is important. It can advance research on drivers of THV at destinations. It can also assist tourism leaders in tackling the problem at tourist hotspots. Note, that the researcher's focus in this project was not on predicting THV, but on developing hypotheses for future testing. Hence, the researcher used a qualitative research approach for the inquiry.

LITERATURE REVIEW

Learning occurs cognitively. It happens passively as well (Skinner, 1981). Skinner (1948) believed humans acquire behaviors to survive in their environment. Using the findings of previous studies as the basis, the present author thinks certain NE-SFs may be connected to THV at destinations. Such as high but tolerable temperature and humidity levels (Griffitt & Veitch, 1971); noise pollution (Fakhrahmad et al., 2022); dirtiness and smelliness (Fakhrahmad et al., 2022); high population density (Griffitt & Veitch, 1971) in the space among other factors. The present study aims to confirm this.

METHOD

To accomplish the goal of the study, the researcher intends to analyze over 1,000 blog posts that chronicle visitors' experience with THV at a destination and the setting in which it occurred. The researcher used and will continue to use blog posts on the famous travel website, TripAdvisor. The target period for the posts was THV which occurred between 2010 and 2024. The researcher took steps and will continue to take measures to ensure the credibility,

dependability, confirmability, and transferability of the studies' findings. The researcher used thematic content analysis to determine the preliminary results.

PRELIMINARY FINDING

One preliminary finding from the study was crowding, such as at beaches and markets, was a noteworthy setting factor associated with THV at destinations.

ABSTRACT

The purpose of this study is to examine how the quality of wellness tourism information on social media influences young tourists' loyalty to a destination. It also examines whether there are generational differences between Generation Y and Generation Z tourists' perceptions of information quality and their wellness tourism decision-making process.

Key Words: SOR theory; Customer satisfaction index; Information quality; Destination image; Generational theory; Loyalty

INTRODUCTION

The COVID-19 pandemic has severely impacted the wellness tourism market. According to data from the Global Wellness Institute (2021), global spending on wellness tourism reached $435.7 billion in 2020, reflecting a 39.5% decrease from 2019. Nevertheless, the wellness tourism market is gradually recovering and poised for further expansion. Research and Markets (2023) project that the global wellness tourism market is expected to grow at a compound annual growth rate (CAGR) of 11.67%, reaching $797.376 billion by 2028. This sector is anticipated to

be the fastest-growing segment among all health industries (Global Wellness Institute, 2021). This growth can be attributed to two main reasons: the ongoing expansion of the middle class, an aging population, and the persistent rise in chronic diseases; and the heightened focus on physical and mental health due to the COVID-19 pandemic, prompting individuals to reconsider the work-life balance (Global Wellness Institute, 2021).

Most of the current literature in the field of wellness tourism focuses its research primarily on the middle-aged and elderly tourist demographic, including the Baby Boomer generation and Generation X (Kan et al., 2023; Patterson & Balderas-Cejudo, 2022). This trend is also consistent with the reason one above. Unexpectedly, however, young tourists (Generation Y and Generation Z) are considered a crucial component of the future wellness tourism market (Research and Markets, 2023). They exhibit a more positive inclination toward engaging in wellness tourism activities compared to other surveyed age groups (American Express, 2023). This may be attributed to the fact that wellness tourism aims to improve mental and physical health, achieve a healthy lifestyle, reduce stress, prevent disease and minimize bad habits through activities such as yoga, spa, and meditation (Global Wellness Institute, 2021). This characteristic aligns with the current lifestyle trends of Generation Y and Generation Z, emphasizing mindfulness and proactive health (Dziadkiewicz, 2023). Therefore, given the significant market potential of the younger demographic, they merit continued attention from both the academic community and the wellness tourism industry (Dziadkiewicz, 2023).
In order to attract the younger tourist demographic, wellness tourism destinations need to employ various effective marketing strategies to ensure awareness and adoption, one of which is social media marketing (Anannukul & Yoopetch, 2022). This is because Generation Y and Generation Z primarily acquire information through social media platforms (Șchiopu et al., 2023; Werenowska & Rzepka, 2020). Social media is an important tool for content marketing (Du Plessis, 2017), and also a significant information source for tourists (Liu et al., 2020). In addition to actively seeking out information of interest, tourists are also recommended travel information by platforms that may match their needs and preferences (Wang, 2020). Information on social media can influence tourists' travel decisions and fundamentally alter their travel plans (Dwityas & Briandana, 2017). However, while the quantity and quality of information on social media is vast and varies, current empirical studies have rarely examined how the quality of travel information on social media affects tourists' decision-making process (Wang & Yan, 2022). Particularly, with the widespread adoption of the wellness tourism concept, an increasing number of destinations have developed local tourism resources to enter the market. For destinations, in order to improve the competitiveness of the industry, there is a need to increase the loyalty of tourists on top of finding ways to attract new tourists. In this context, it is essential to explore how the decision-making process of these potential repeat visitors is formed.

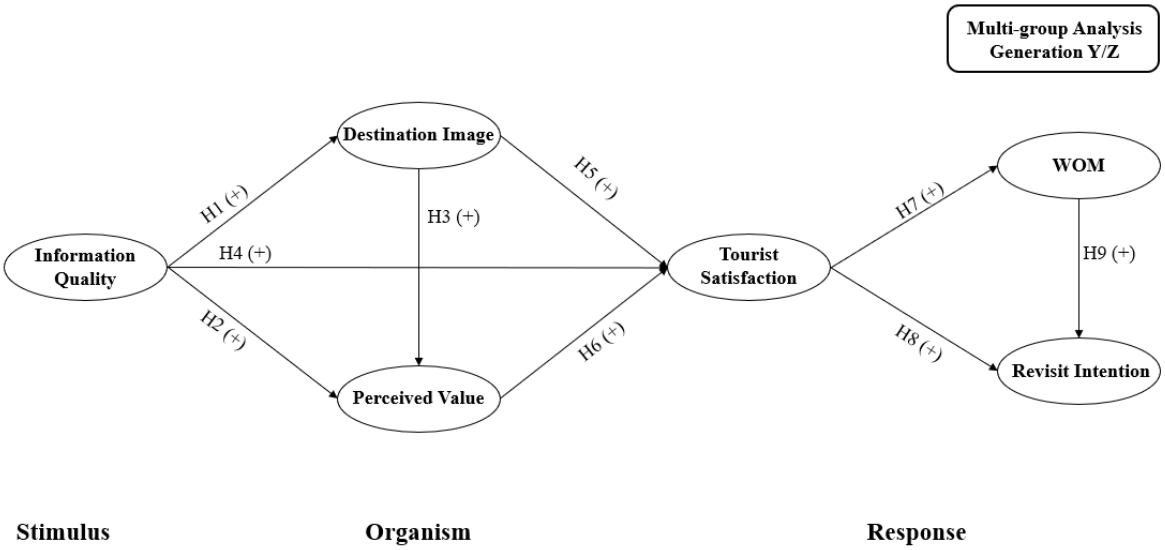
Furthermore, the potential divergent behavioral tendencies in the decision-making process of Generation Y and Generation Z in wellness tourism warrant further exploration. This is attributed to differences in the use of digital technology, information acceptance, travel preferences, and perceptions of health between the two generations (Dziadkiewicz, 2023; Euajarusphan, 2021; Uysal, 2022).

This study is conducted against the backdrop of Japan. While the proportion of young people in Japan suffering from various diseases is lower than that of the elderly, it still accounts for around 20%. Additionally, the population experiencing higher levels of stress, depression, anxiety, and other emotional issues is even higher among the youth, reaching approximately 30% (MHLW, 2022). Furthermore, Japan is rich in natural resources and also has a unique culture and traditional practices. Some regions are utilizing local resources for wellness tourism projects. These are important driving factors for the development of wellness tourism. However, the concept of wellness tourism in Japan is not yet widely recognized and the industry is still in the beginning of its development. Existing relevant studies are also limited and more research is needed to fill the gaps.

METHODOLOGY

Given the above, this study combines Stimulus-Organism-Response Theory (SOR Theory) and Customer Satisfaction Index (CSI) to construct a new conceptual model, as shown in Figure 1. A quantitative study will be conducted to understand young Japanese tourists' perceptions of the quality of wellness tourism information on social media and to further explore the factors that influence their travel decision-making process.

Figure 1
Conceptual Model



The conceptual model seeks particular answers with respect to the following research questions:

RQ1: How does the quality of information about wellness tourism on social media influence young Japanese tourists' loyalty to a destination?

RQ2: Which dimensions of information quality are actually of interest to young Japanese tourists?

RQ3: Are there generational differences between Generation Y and Generation Z tourists' perceptions of information quality and their decision-making process for wellness tourism.

To measure the constructs of the study model, scale items were developed based on existing literature, adapted to the research context of wellness tourism. All of the items were assessed using a 7-point Likert scale, with answer choices ranging from "Strongly Disagree" (1) to "Strongly Agree" (7). Because the original scale items were in English, several scholars who were familiar with both English and Japanese were invited to review the final items to ensure content validity, equivalence of meaning, and authenticity of expression.

The survey will be commissioned to the Japanese survey company Freeasy in April 2024. The survey targets individuals born in 1987 or later who have previously searched or browsed travel information related to a wellness tourism destination on social media and have visited that wellness tourism destination. The number of Generation Y and Generation Z respondents will be controlled in order to align them overall, with an anticipated collection of 400 questionnaires from each generation.

A partial least squares structural equation modeling (PLS-SEM) analysis will be conducted using SmartPLS 4 to test the proposed hypotheses and model fit. PLS-SEM has a high degree of flexibility in dealing with complex models and small sample sizes. Therefore, PLS-SEM is considered a more suitable analytical tool applicable to this study (Hair et al., 2011). The PLS algorithm and bootstrapping (5000 subsamples) were used to evaluate the measurement and structural models, respectively. Multi-group analysis will also be used to compare the effects of different generations on the results of the analysis (Hair et al., 2016).

IMPLICATIONS

This study is expected to make the following contributions: (1) to aid in the construction of a theoretical framework connecting social media information quality and destination loyalty; (2) to provide empirical support for the development of generational differences through a comparison of Generation Y and Generation Z; (3) to assist destination operators in gaining a deeper understanding of the specific preferences of young tourists from different generations in the context of wellness tourism. This knowledge can help them provide information and services that align more closely with expectations, thereby enhancing their competitiveness in the wellness tourism market.

DOES CLIMATE CHANGE AFFECT TOURISM IN MAURITIUS: A NON-LINEAR PERSPECTIVE

Jeevita Shashi Matadeen (corresponding author)

University of Mauritius

Lydie Myriam Marcelle Amelot

University of Mauritius

ABSTRACT

Climate change is widely acknowledged as one of the major challenges that our planet is facing. Unfortunately, the trapped greenhouse gasses lead to global warming and shifts in weather patterns, which in turn have direct and indirect consequences on all countries at an ecological, physical and socioeconomic level. These impacts have more disastrous implications for small island developing states (SIDS) due to their unique and distinct characteristics. Indeed, SIDS are more vulnerable to flash floods, droughts, cyclones, soaring temperatures and rising sea levels. Mauritius, a SIDS which ranked 46 by the Climate Vulnerability Index Ranking, has not been spared by the consequences of climate change, despite only contributing 0.01% to the greenhouse gas emissions. One of the indirect, but still alarming, impacts of climate change in Mauritius, is the negative influence that it has on the number of tourist arrivals in the country. Indeed, given its high dependency on the tourism sector, the economic growth of the island will be hampered. As such, this paper aims to investigate the impact of climate change on the tourism sector during the period 1990-2021. Unlike previous studies, this paper innovatively explores the possibility of the relationship being potentially a nonlinear one, through a Threshold Autoregressive Model (TAR). To capture climate

change, the paper resorts to three different proxies, namely precipitation, temperature and carbon dioxide emissions. The impact of each proxy on the number of tourist arrivals in Mauritius will be investigated individually at first. Subsequently, the three proxies will be combined together to form an index for climate change through the Principal Component Analysis method (PCA) to assess whether the relationship still holds between climate change and tourism.

TANJUNG PUTTING NATIONAL PARK TOURISM: WILL DESTINATION PUBLICITY BE PIVOTAL KEY FOR TOURISTS' VISIT INTENTION?

Usep Suhud
Faculty of Economics, Universitas Negeri Jakarta, Indonesia
usuhud@unj.ac.id
Sean Chung
Salford Business School, University of Salford, UK
s.chung@salford.ac.uk

Abstract

Publicity plays a crucial role in creating and enhancing the popularity of a tourist destination. It can be generated by destination managers or external entities such as mass media and visitors. This study examines the impact of publicity on destination awareness, destination attitude, destination preference, destination image, and visit intention. Research on destination publicity has received limited attention from scholars, making this study significant. The focus is on Tanjung Puting National Park in Central Kalimantan, Indonesia, which is known for being the habitat of orangutans. Data were collected through an online survey involving 221 participants selected using convenient sampling. The collected data underwent exploratory factor analysis, confirmatory factor analysis, and structural equation model analysis. The results indicate that publicity significantly influences destination awareness, destination attitude, destination preference, and destination image. Additionally, destination awareness, destination attitude, and destination preference significantly impact visit intention. However, destination image fails to exert a significant influence on visit intention. This research contributes to the broader understanding of destination publicity and further enriches the study of national park tourism. Focusing on Tanjung Puting National Park sheds light on the specific dynamics of a unique destination, emphasising the importance of strategic publicity efforts in shaping tourists' perceptions and intentions.

Keywords: national park tourism, destination publicity, destination awareness, destination preference, destination image

EXAMINING THE INFLUENCE OF ADAPTIVE BEHAVIOR ON TOURIST SATISFACTION AMID CLIMATE CHANGE CHALLENGES

ABSTRACT

Climate change is changing how tourists behave at destinations, potentially affecting their satisfaction and overall tourist experience. This study explores the relationship between adaptive behavior and satisfaction, considering the moderating effect of pro-environmental behavior and destination image. The research was conducted through a survey, and the Italian Apulia region was considered as the study area. The results show a positive relationship between adaptive behavior and satisfaction, a relationship that is positively moderated by pro-environmental behavior and destination image.

Key Words: Climate change; Adaptive behavior; Pro-environmental behavior; Destination Image; Tourist satisfaction.

INTRODUCTION

Climate change represents a crucial challenge of the 21st century, characterized by the idea of the Anthropocene (Cruzen, 2005), an era influenced by human action on Earth. The Anthropogenic origin of the phenomenon, visible in the abrupt climate change and global temperature rise, has stimulated a wide-ranging, widespread, and contradictory debate. Impacts like melting ice and extreme weather events point to a worrying future. Time pressure, represented by the 'Climate Clock', emphasizes the urgency of reducing emissions within a short timeframe to avoid irreversible events. Climate change is also impacting tourism and tourist' choices. In the field of tourism sustainability, studies on climate change started as early as the 1990s and reached a more conscious level after 2000 (Scott et al., 2005). Much of the literature from 2007-2023 has been concerned with studying tourists' concerns, attitudes, and social behavior concerning climate change (Pan et al., 2023). Climate change effects could significantly impact tourists' decision-making process (Gössling & Hall, 2006; Scott et al., 2008), both on the choice of tourist destination (Lin and Wang, 2023) and on the choice of activities (Hopkins & Maclean, 2012). Tourists, therefore, are forced to adapt their behavior, such as modifying their plans and performing alternative activities (e.g., cultural events, shopping), when they are in a tourist destination affected by climate change.

Adaptive behavior (ADB) refers to an individual's ability to adapt and cope effectively with different situations, challenges, and conditions, demonstrating flexibility and resilience to adapt to changing circumstances. ADB generally assesses an individual's ability and degree to meet the standard of independence and responsibility within their environment.

Although a lack of a comprehensive construct and theoretical framework for ADB, previous research has identified two essential dimensions: ensuring safety and health, and maintaining socially acceptable behavior (Wattanacharoensil et al., 2023). Woodruff (2019) proposed a model of adaptive behavior in medicine, suggesting that ADB encompasses cognitive, emotional, and social skills and attitudes that enable problem solvers to adapt to change. In our study, we explored the potential alternative decisions made by tourists when implementing ADB in response to climate change.

Adaptive behavior, in turn, may influence tourist satisfaction, understood as the tourist's response to the congruence between performance and comparison standards (Oliver, 1980). Satisfaction with the implementation of ADB could be influenced by pro-environmental behavior and destination image. Many tourists adopt pro-environmental behavior, i.e., actions that aim to reduce their environmental impact through the sustainable consumption of natural resources (Esfandiar et al., 2020). Tourists' desire to reduce their environmental impact may lead them to renounce unsustainable actions and adapt their behavior (Esfandir et al., 2020). Pro-environmental behavior may lead them to feel more satisfied with sustainable tourism choices (de Oliveira et al., 2020).

Previous research demonstrated that destination image has a positive effect on tourists' satisfaction (e.g., Bui & Le, 2016; Chi & Qu, 2008; Xie et al., 2020). In addition, prior research, Tasci and Gartner (2007) for example, has shown that the experience of visiting a destination has a direct impact on the formation of the destination's image. Thus, we consider that destination image can have a moderating effect on tourist satisfaction that embraces climate change adaptive behaviors in the destination.

The literature to date has primarily focused on the study of how climate change impacts tourist destination choice. To our knowledge, no study has focused on ADB and how this affects tourist satisfaction. This research focuses on tourists' ADB in a destination affected by climate change. Specifically, the aim of this study is to investigate the

relationship between ADB and tourist satisfaction. Furthermore, the aim is also to investigate whether pro-environmental behavior and destination image moderate the relationship between ADB and tourist satisfaction.
The hypotheses formulated for this study are:

H1: Adaptive behavior positively influences tourist satisfaction;
H2: Pro-environmental behavior moderates the relationship between adaptive behavior and tourist satisfaction;
H3: Destination image moderates the relationship between adaptive behavior and tourist satisfaction.

METHODOLOGY

To achieve the research objectives, the Italian region of Apulia was taken as the study area. This region has experienced an increase in average maximum temperature in recent years (from 19° in 2010 to 20.2° in 2017). During the summer of 2023, the region was hit by strong anomalous heat waves which had implications for the tourism sector.
The research was conducted by administering a survey to a random sample of 4,051 people from 8 countries: Australia, Brazil, Canada, France, Italy, Poland, the UK, and USA. The questionnaire consisted of a first section on travel habits, a second section on environmental behavior and, a third section on tourists' adaptation to climate change in Apulia. The questionnaire used Likert scales from 1 (strongly disagree) to 10 (strongly agree).
To analyze the results, only participants who have at least heard of Apulia and only those who know about 'climate change' were considered (2,383 participants). The final sample consisted mainly of Gen Y (40%) and Gen X (30%).
Multiple linear regressions conducted with SPSS software have been used to analyze the collected data.
The correlation coefficient index was calculated to measure the strength of the relationships (R).
In addition, the analysis of variance (ANOVA) was conducted by performing the F-test and calculating the p-value of the F-test. Finally, the calculation of the significance coefficient made it possible to find out whether the considered predictor has a significant effect on the dependent variable.

FINDINGS

The research results confirm all hypotheses. Adaptive behavior has a positive influence on tourists' satisfaction in adapting to the effects of climate change (*p-value = < 0.001*). Furthermore, pro-environmental behavior and destination image moderate the relationship between adaptive behavior and tourist satisfaction (*p-value = < 0.001*).

Table 1
Regression model of the overall sample

Hypothesis	**R**	**F ANOVA**	**ANOVA Sign.**	**T**	**P-value**

H1	0,55	1046,37	< 0,001	32,35	< 0,001
H2	0,60	434,96	< 0,001	10,83	< 0,001
H3	0,60	449,25	< 0,001	12,38	< 0,001

DISCUSSION AND CONCLUSION

Research results show that adaptive behavior (ADB), and thus the choice of alternative activities, would still make the tourist satisfied. Furthermore, consumers who tend to choose sustainable tourism services and offers in their life, and thus to adopt pro-environmental behavior, is more satisfied. The image of the destination also plays a key role: tourists who evaluate the image of Apulia positively are more satisfied, despite having had to adopt adaptive behavior.

There is a way, therefore, for tourist destinations to remedy the negative effects of climate change in order to keep tourism alive: to offer tourists the possibility of alternative activities that they consider appropriate in the light of climate change. In this way, there is the possibility of protecting tourism in a particular area and keeping tourist satisfaction alive. Therefore, to face the challenge of climate change and the impact on tourists' choices, Apulia needs to adopt adaptation and mitigation strategies that are able to preserve the region's tourist attractiveness. This study provides practitioners and local administrators with guidance on how to plan tourism experiences in view of climate change uncertainties.

The research conducted creates a breakthrough in the literature, addressing for the first time the issue of tourists' satisfaction with adapting their behaviors in a tourist destination in the light of climate change. Furthermore, for the first time, moderating variables of pro-environmental behavior and destination image are considered. However, the study has limitations. No differences between countries were considered; future research could test the hypotheses in different countries. Furthermore, the study considers only one study area, the region of Apulia; the study could be conducted considering a wider area.

INTIMIDATING MICRO-TRADING ON VISITORS' INTENTION TO SUPPORT MICROENTREPRENEURS AT DESTINATIONS: POSSIBLE MODERATORS

Annmarie Nicely
Purdue University
West Lafayette, Indiana, USA

ABSTRACT

The goals of the present study were to determine the impact of intimidating micro-trading (IMT) on visitors' intention to support micro-entrepreneurs at a destination (SUPPORT). Then to ascertain whether five visitor thoughts could reduce any negative impact of the former on the latter. The thoughts and possible moderators of the relationship between the two examined were the following. If visitors thought: the good at the destination exceeded the bad; they knew how to avoid trader harassment at the location; trader harassment of visitors (THV) was normal; they knew how to manage trader harassment at the location; and THV was rare at the destination. Domestic and international visitors to tourist hotspots in Mexico were studied. Surveys were administered to the target population using a popular online platform. The researcher analyzed the study's data using a four-step moderated regression analysis. None of the five factors examined emerged as significant moderators of the relationship between IMT and SUPPORT. Instead, four noteworthy predictors of SUPPORT arose. For example, one predictor of SUPPORT was the construct, previous visit to the destination.

Key Words: Visitor harassment, tourist harassment, aggression, SMEs, vendors, Mexico.

INTRODUCTION

Trader harassment of visitors (THV) is an unwanted behavior directed toward visitors by micro-entrepreneurs at destinations. One form of THV concerning destination managers is intimidating micro-trading (IMT). IMT is selling practices by microentrepreneurs that result in visitors feeling afraid. Over the years, there have been several reports of IMT at tourist hotspots globally.

In 2024, little was known about the actual effect of IMT on tourist locations. *For example, does IMT harm visitors' intention to support micro-entrepreneurs at destinations in the future (SUPPORT)? Or are micro-trading communities not severely impacted by such practices, and why? Can certain visitor thoughts reduce the economic fallout of such practices on micro-trading communities?* Based on a previous study (Nicely & Morrison, 2019) five visitor thoughts were explored. They are if they thought the good at the destination exceeded the bad *(moregood)*. They knew how to avoid trader harassment (TH) behaviors at the destination *(avoid)*. Such behaviors were normal *(normal)*. They knew how to manage TH at the destination *(handle).* Such behaviors were rare at the location *(rare)*.

Hence, the study's goal was to determine of the five thoughts that would be significant moderators of the relationship between IMT and SUPPORT when the visitors' gender, education level, income level, previous travel experience, and type – domestic versus international, are statistically controlled. The researcher examined Mexico.

The study was significant for several reasons. One reason is the findings could assist destination managers in Mexico, and similar locations, in reducing any harmful effect of IMT on SUPPORT.

LITERATURE REVIEW

According to the *theory of planned behavior*, thoughts will influence intention and intention behavior (Ajzen, 1991). Particularly, the more an individual thinks the target behavior is good (like supporting the local micro-traders) and the alternative decision bad. The target behavior is supported, and the alternative is not. And the target behavior is easy, and the alternative is difficult. The greater the likelihood that one will have positive intentions toward the target behavior and engage in the behavior (Ajzen, 1991).

METHODS

The researcher conducted a quantitative four-step moderated regression study. The target population for the study's survey was visitors over 18 years of age (domestic and international) who visited Mexico and were harassed by a micro-entrepreneur at the destination. To get the data needed, the researcher used the popular crowdsourcing online platform Amazon Mechanical Turk. The researcher paid the platform US$1 for each completed survey received. The researcher also took measures to ensure the validity and reliability of the study’s findings.

FINDING

No moderators of the relationship between IMT and SUPPORT emerged. Instead, the four-step regression analysis revealed four significant predictors of SUPPORT. One was the construct, *previous visit*. Repeat visitors were more likely to support the micro-traders in the future after being harassed by a member of their community.

DIVERSITY, EQUITY, AND INCLUSION (DEI) IN CORPORATE MOBILITY THROUGH HOSPITALITY DIMENSIONS: A SYSTEMATIC LITERATURE REVIEW

Diego R. Santos

Universidade Anhembi Morumbi

São Paulo, SP, Brazil

Elizabeth K. Wada

Universidade Anhembi Morumbi

São Paulo, SP, Brazil

ABSTRACT

Corporate mobility is a multifaceted activity that encompasses various business functions. Social markers such as race, gender, generation, class, nationality, etc., influence the way these displacements occur. The values embedded in the triad of diversity, equity, and inclusion (DEI) have become increasingly important in modern organizations as they recognize the advantages of having a diverse workforce and emphasize the creation of an inclusive work environment. This study aims to identify the relationships between hospitality, diversity, equity, and inclusion (DEI) in corporate mobility within the context of business travel. To achieve this, a systematic literature review (SLR) was conducted.

Key Words: hospitality; corporate mobility; diversity, equity, and inclusion (DEI).

INTRODUCTION

Corporate mobility, or business mobility, is a socio-economic practice involving the movement of individuals or groups to engage in economic activities. It encompasses various corporate functions, including managerial oversight, procurement, business development, and employee training (Jones, 2013).

Social markers such as race, gender, generation, class, nationality, among others, create tensions, hierarchies, and discrepancies in modes of mobility (Freire-Medeiros & Lages, 2020; Urry, 2007), as well as exclusion from public space, citizenship, access to resources, and means of mobility (Sheller, 2018). Thus, it is impossible to ignore how these markers influence how business travelers belonging to marginalized groups are also impacted in their business travels.

According to Shortland and Perkins (2022), the academic literature on expatriation and gender is extensive, with seminal work by Adler (1984b) laying the foundation, followed by others addressing the presence of women in this context (Altman & Shortland, 2008; Hutchings & Michailova, 2017; Shortland & Altman, 2011). Additionally, Shortland and Perkins (2022) note a recent increase in research exploring other aspects of diversity such as the sexual orientation of expatriates (Gedro, 2010; McPhail, 2017) and race (Baruch et al., 2016). However, topics like religion, age, intersectionality, as well as the role of organizations in advancing the representation and inclusion of minorities in expatriation, are less frequently studied.

Despite the growth of other forms of global mobility in recent decades (Kirk, 2016), there appears to be a theoretical gap when examining the scope of investigations into business travel exclusively (Mäkela, Kinnunen,
& Suutari, 2015), as well as other modes of work such as short-term assignments in other locations or routine international travel (Mäkelä et al., 2017), or even global work teams (Brandl & Neyer, 2009).

Furthermore, it is observed that employee mobility is facilitated through service provision and the relationships established among various stakeholders, ranging from the travel service provider to those responsible for transportation, accommodation, and catering for travelers. Therefore, the inclusion of hospitality practices is essential for the success of corporate mobility processes (Goldenberg & Wada, 2017).

Thus, this study is guided by the following research question: What is documented in scientific databases regarding corporate mobility connected to diversity, equity, and inclusion? Therefore, the main objective is to understand the issue of diversity, equity, and inclusion in corporate mobility, specifically in the context of business travel, through hospitality dimensions.

LITERATURE REVIEW

Corporate Mobility

Economic globalization and advancements in transportation and communication technologies have been crucial for the increase in travel. The movement of businesspeople, tourists, and diasporas has driven the mobility of capital, products, services, individuals, knowledge, and even diseases from one locality to another (Sum & So, 2004; Urry, 2004). Particularly regarding globalization, it is no coincidence that mobility issues have become a relevant topic in debates proposed by geography and sociology due to the growing forms of hypermobility that shape the lives of numerous workers (Beaverstock et al., 2016).

Therefore, corporate mobility is interpreted as a management strategy aimed at eliminating geographical barriers to drive the growth and success of an organization. It involves the mobility of employees through travel and/or the use of technological tools, enabling employees to be where they can add the most value (Harper & Runzheimer, 2010). Additionally, relocation programs, international assignments or missions, and virtual offices, among other technologies capable of replacing travel, contribute to agility and expand the geographic reach of employees to nearby or distant locations (Harper & Runzheimer, 2010; Wada et al., 2014).

Corporate travel encompasses trips for business purposes, visits to business partners and other relevant stakeholders in the company's industry, incentive trips, and travel for participation in corporate events (Wada, 2009). These trips are undertaken by business professionals, representatives of companies, who are motivated by their roles within the company and have their travel expenses covered by it (Guizi, Wada, & Gândara, 2016), including employees, third-party professionals, or guests of legal entities (Martins & Murad Jr., 2019).

Corporate mobility enables travelers to experience variety (of tasks, people, and destinations) and novelty, among other positive aspects such as excitement, glamour, and personal development. However, on the flip side, travel, apart from separating business travelers from their families and demanding more professionally, can provoke stress and pose health and safety risks (Welch & Worm, 2006). Therefore, there is a need to understand corporate mobility as an investment, with management aimed at ensuring the satisfaction and well-being of travelers, as well as the best cost-benefit ratio for companies (Ferreira & Wada, 2011).

Hospitality

Hospitality can be portrayed not only as a key component in the evolution of the human species but also understood as a fundamental aspect concerning social interaction and socialization, going beyond the mere provision of food, drink, or accommodation (Montandon, 2003). The broadening of understanding about hospitality presupposes that it is based on the construction of a relationship between an individual acting as a host and another who assumes the role of guest (Lashley & Morrison, 2000). Hospitality is understood as a multidisciplinary lens for investigating society, examining relationships in the business field, and its own management (Lashley, Lynch, & Morrison, 2007). Hospitality is seen as a tool capable of promoting effective social analysis, revealing mechanisms of inclusion or exclusion in various spheres as well as in everyday experiences and encounters with differences (Lynch et al., 2011).

Understanding the social value of hospitality as well as hospitableness, which refers to the behavior of naturally hospitable individuals, not only facilitates the application of concepts in a commercial context but also in the management process (Lashley, 2015). In this case, it is inferred that the creation of moments of hospitableness and the transformation of places into hospitable spaces can occur not only by those who take on the roles of host and guest but also among the guests and/or consumers themselves in hospitality environments within a commercial context, resulting in meta-hospitality, which occurs through emotional transactions among those involved in hospitable interactions, where roles are alternated or dynamized and differences are attenuated (Lugosi, 2008).

Thus, the environment, the physical space, seems insufficient to explain how to build a hospitable experience. For this purpose, the concept of *experienscape* is relied upon, which pertains to the sensory, functional, social, natural, and cultural stimuli in a product or service environment, conveyed through a culture of hospitality. This culture corresponds to the exceptional provision of services and the creation of memorable experiences for various stakeholders (Pizam & Tasci, 2019). At the heart of the consumer experience environment, it is suggested to focus on human-centered outcomes such as

transformation, subjective well-being, subjective happiness, and quality of life (Tasci & Pizam, 2020). In conclusion, there is a growing demand for hospitality characterized by humanity, personalization, and non-protocol cordiality, both in familial and commercial contexts, including tourism. Successful interactions result when the unwritten laws of hospitality are observed (Camargo, 2021).

Managing Diversity and Inclusion in Organizations

By definition, whether at the local or global level, diversity management can be understood as the set of voluntary or involuntary actions of an organization designed to promote the inclusion of employees from different backgrounds in various instances of the organizational structure through policies and programs (Mor Barak, 2017). This makes inclusion essential concerning the role of diversity managers, their thoughts on the subject, and how diversity management, itself, occurs in practical and measurable terms within companies (Özbilgin, Tatli, & Jonsen, 2015).

Through inclusion, one captures and communicates how individuals and organizations should behave and what is necessary to benefit from diversity (Ferdman & Deane, 2014; Miller & Katz, 2002; Özbilgin, Tatli, & Jonsen, 2015). Moreover, the practice of inclusion occurs through understanding and leveraging the benefits of the multiple facets of diversity, through participation, contribution, vocalization, and expression of differences and similarities (Ferdman & Deane, 2014).

Nevertheless, two other themes are of paramount importance when discussing diversity management. The first concerns equity, as it suggests collective concern for individuals' conditions, distributing resources fairly, and surpassing the notion that merely offering equal opportunities is sufficient (Bjørn, Menendez-Blanco, & Borsotti, 2023).

The second refers to intersectionality, which helps understand, similar to theories of social identity, the connections established among team members, and the inclusive climate capable of reducing barriers and increasing people's ability to relate to others within an organization (Mor Barak et al., 2016). It represents the complex overlap of diversity dimensions, treating them not as mutually exclusive to the point of being disregarded or invisible in management interventions (Bjørn, Menendez-Blanco, & Borsotti, 2023).

Despite some research evidencing certain hypocrisy, instrumentalization, and negative reactions towards diversity management, the effectiveness of its management fosters competitive advantages and positive outcomes in terms of economic, social, and environmental aspects, as well as improvements for the organization, teams, and their members in terms of well-being, performance, engagement, among other benefits (Özbilgin, Bartels-Ellis, & Gibbs, 2019). Therefore, the values embedded in the triad composed of diversity, equity, and inclusion (DEI) have become increasingly important in modern organizations as they recognize the advantages of having a diverse workforce and prioritize building an inclusive work environment, not only for ethical reasons but also for fostering creativity, innovation, performance, and success (Khan & Khan, 2023).

METHODOLOY

In this exploratory study aiming to understand the scientific production of corporate mobility and its relation to diversity and inclusion, the researchers employed a systematic literature review (SLR). This method has become popular in fields related to tourism and hospitality studies (Prayag et al., 2019). Systematic reviews stand out for their adoption of rigorous methodology and presentation, ensuring replicability (Siddaway et al., 2019).

Following the guidelines outlined in the 2020 PRISMA statement (Preferred Reporting Items for Systematic Reviews and Meta-Analyses), they designed a study protocol owing to its widely used checklist across various research areas (Siddaway et al., 2019). The PRISMA 2020 guidelines provide updated instructions and reflect advancements in methods for identifying, selecting, evaluating, and synthesizing studies (Page et al., 2021).

The authors chose Scopus and Web of Science (WoS) as the databases due to their reputation and extensive coverage of data from various scientific areas and academic disciplines worldwide. They conducted a search in the databases on October 27, 2023, and another on January 20, 2024, using a search string defined based on the platforms' operators and the combination of terms: "corporate mobilit*", "business travel*", and "diversity and inclusion". For the review process, they employed the use of the systematic review development software StArt Version 3.4 Beta (UFSCAR/Lapes). To select the retrieved records, they included inclusion and exclusion criteria associated with quality criteria (Table 1), following the procedure outlined by Valle et al. (2022). The screening process was led by one of the investigators, while the other was responsible for the review.

Table 1
Selection Criteria

Criteria		Description
Inclusion	I1	Articles available in databases or search engines.
	I2	Scientific articles from journals.
	I3	Articles containing the search terms used in the title, abstract, keywords, or text.
	I4	Articles that relate corporate mobility to the issue of diversity and inclusion.
Exclusion	E1	Documents in formats other than scientific articles.
	E2	Restricted articles, not available in databases or search engines.
	E3	Articles that do not contain the search terms used in the title, abstract, keywords, or text.
	E4	Articles that do not address corporate mobility and the issue of diversity and inclusion.

Quality	Q1	Does the text address corporate mobility in the context of business travel?
	Q2	Does the text reference the theme of diversity and inclusion?
	Q3	Does the study allow for establishing connections with hospitality?

In the search stage, the document type filter was applied to limit the survey only to scientific articles. Only articles published in English were selected. This search retrieved 72 records. Within this set, no duplicate items were identified. Subsequently, the authors excluded nine restricted documents not available in databases or search engines, leaving 63 articles for the next stage. Through the examination of titles, abstracts, keywords, and text, the inclusion and exclusion criteria were applied. They removed 59 articles, and four documents were left.

They evaluated these records based on quality criteria, conducting a full reading of the texts, and discarding two articles that did not meet the study's purpose. Two articles were left for the composition of the final *corpus*. At this stage, they sought to establish connections with hospitality based on the dimensions of hospitality proposed by Bastos and Rejowski (2015), treated as thematic categories in the section presenting and analyzing the results.

FINDINGS AND DISCUSSION

The final sample of this systematic literature review consists of two articles that allow for the connection of hospitality to the issue of diversity and inclusion in corporate mobility. Table 2 presents a summary of data from the selected articles, as well as the thematic categories related to hospitality and its dimensions.

Table 2
Final sample of articles included in the review

Author (year)	Title	Journal	Purpose	Keywords	Category (hospitality dimensions)

Hutchings, Lirio e Metcalfe (2012)	Gender, globalisation and development: a reevaluation of the nature of women's global work	The International Journal of Human Resource Management	Explore the perceptions that Middle Eastern and North American women have of traditional and new trajectories in global work and careers	development organisations; global careers; Middle East; North America; women	Cultural; Economic; Educational; Social.
Kirk (2019)	Identity, glass borders and	Journal of Global Mobility	Explore the interplay between identity and	Women, Identity, Glass ceilings, Global	Cultural; Economic; Educational; Social.

	globally mobile female talent		global mobility in the careers of senior, female talent, uniquely taking into account the perceptions of both female and male participants.	mobility, Organisational support	

Both articles included in the final sample of the review address the issue of global mobility of women both in terms of career and travel. In Hutchings, Lirio, and Metcalfe's (2012) article, they explored how women from the Middle East and North America perceive traditional and emerging global work and career paths. It was pointed out that women are still underrepresented among expatriate managers due to various cultural and organizational barriers, leading them to seek options such as frequent travel towards global careers or national positions involving international development or community work. Regarding business travel, Hutchings, Lirio, and Metcalfe (2012) noted that for North American women, international business travel and virtual work facilitated global-level work in line with family responsibilities and global career aspirations. However, this proved to be different for women from the Middle East who were more inclined towards long-term international assignments abroad due to social values and lack of government and organizational support.

Hutchings, Lirio, and Metcalfe (2012) found that bias against foreigners and corporations' resistance to supporting women's global careers are still predominant, as suggested in previous research (Adler, 1984a, 1984b). The study concludes that women's experiences are shaped by social norms, organizational structures, and educational, economic, and institutional systems that affect gender relations. In parallel, it is suggested that human resource professionals pay attention to the global talent management strategy, adapting international opportunities to employees' life stages and cultural constraints.

On the other hand, Kirk (2019) investigated the role of identity in different forms of global talent mobility of the female gender in an American multinational company. The research showed that unlike men,

women face external and internal pressures according to the role they play (whether as mothers, daughters, wives, etc.), having greater difficulty in separating home life from professional life.

Kirk (2019) highlights that for women with dependents, relocation is less preferable due to the family disruptions it causes; however, international travel, flexpatriation, and temporary assignments are considered less stressful than moving to another country. Based on the findings of this study, the relevance of practical and emotional

support for all types of globally mobile talent is emphasized, not just for corporate travelers, as previously noted by Puchmüller and Fischlmayr (2017).

Furthermore, the author emphasizes that women can benefit from access to different identity narratives to make more assertive decisions about which form of mobility best suits their reality, ranging from business travel, and global mobility, to expatriation. By relating the studies of Hutchings, Lirio, and Metcalfe (2012) and Kirk (2019), included in this systematic review, to the dimensions of hospitality according to Bastos and Rejowski (2015), we identified adherence to four of the nine established by the authors, which are discussed below.

Cultural Dimension

According to Hutchings, Lirio, and Metcalfe (2012), besides the discrimination and limitation of international job opportunities reported by women from the Middle East due to their cultural practices and religious traditions, it was found that long-term international assignments do not seem suitable for North American women in dual- career families, whereas global career opportunities with local involvement do not seem attractive as it is not acceptable for a mother from Middle Eastern countries to stay away from home at night or for long periods. To Kirk (2019), the role of culture is observed in the impact it has on identity and in influencing the choice and acceptance of a mobility opportunity. Furthermore, it reinforces the incipiency of studies investigating the role of identity in the cultural adjustment of expatriates (Glanz, 2003; Kohonen, 2005; Scurry et al., 2013) and the occurrence of maintaining barriers and gender bias depending on the cultural context.

Economic Dimension

Reviewing global female work, Hutchings, Lirio, and Metcalfe (2012) indicate that long-term international assignments in multinational companies do not fully reflect the transformations in work dynamics in a globalized economy. The study offers insights into new forms of global work performed locally, reflecting alternatives to strike a balance between life and family commitments, despite the challenges still faced by women seeking to advance in international careers regarding equitable opportunities, selection process, and remuneration. Combating discrimination and promoting equality can be materialized through gender policies so that women can overcome gender barriers in the workplace and better balance personal and professional life demands (Kirk, 2019).

Educational Dimension

In the analysis of Hutchings, Lirio, and Metcalfe (2012), the value given by Middle Eastern women to previous experiences abroad and education received in the West stands out as a means to break stereotypes about women's roles. However, despite being qualified, interviewees suggested that men tend to be considered more often for international training, conferences, or short-term positions. For North American women, there was no direct discrimination in selection for development opportunities; however, there was no clarity or disclosure from organizations regarding the criteria used. The educational dimension appears in the study of Kirk (2019) in the support that companies can offer to female employees by encouraging the exchange of experiences, giving

meaning to global mobility choices, which can occur through mentoring, networking, and the use of technologies, assisting in promoting a positive identity, expanding the repertoire of perspectives, career management, and competing equally with male colleagues.

Social Dimension

According to Hutchings, Lirio, and Metcalfe (2012), contact networks often depend on social interaction, participation in social events, or drinking after work, where talent search and even promotion prospecting often occur, resulting in a smaller scale of opportunities for women (particularly for Middle Eastern women compared to North American women in the study) compared to men. Kirk (2019), based on Jenkins' (2014) definition of identity work, establishes that this process occurs through the elaboration and reformulation of identities through self-reflection and social interaction. The author considers identity crucial for women regarding the modalities of global mobility they are willing to engage in. Kirk (2019) brought elements that circumscribe it in the social dimension of hospitality concerning the sacrifices made by women regarding their careers to meet family demands and their less selfish behavior compared to their male counterparts regarding adjustments made in their careers to accommodate their spouses' careers.

Implications

Among the implications of this review, not only is the importance of understanding the social value of hospitality and hospitableness in management emphasized (Lashley, 2015), but also in-depth knowledge of cultural processes and limitations in establishing global mobility strategies for building memorable experiences through a culture of hospitality (Pizam; Tasci, 2019), which should not be restricted to customers or consumers but should extend to workers, especially those belonging to commonly marginalized or underutilized groups. To achieve this, the relevance of offering hospitality is recognized not only as a mere corporate policy but as a fundamental resource to foster successful interactions through humanity, personalization, and non-protocol cordiality (Camargo, 2021), and from this review, in short, medium, or long-term global corporate mobility, based on the assumptions of equity (Bjørn; Menendez-Blanco; Borsotti, 2023), and the benefits of diversity management (Özbilgin; Bartels-Ellis; Gibbs, 2019).

CONCLUSIONS

This systematic literature review started with the following question: what is documented in scientific

databases about corporate mobility and the issue of diversity and inclusion? Thus, it sought to understand the issue of diversity and inclusion in corporate mobility, in the context of business travel, through the lens of hospitality. Interfaces were established between the *corpus* of analysis and four dimensions of hospitality, which allowed inferring that the corporate mobility of women on a global scale is crossed by cultural practices, work dynamics, gender barriers, stereotypes, and social conventions.

To sum up, women's corporate mobility can be facilitated through the adoption of global talent management strategies with practical and emotional support, adaptation, and flexibility of international opportunities according to the proponents' life stages and cultural demands, as well as the exchange of diverse experiences and perspectives on forms of global mobility and the implementation of policies to combat gender barriers and gender bias.

Limitations of the research include the small number of databases selected in this systematic literature review and the exclusion of articles in languages other than English. However, these limitations are seen as an opportunity for further investigation. In this context, it is recommended as a possibility for future research to increase scientific databases and texts in other languages, as well as to expand the sample by including other forms of corporate mobility in the scope of analysis, such as expatriation. Similarly, future research is recommended to conduct empirical studies that can identify the opportunities, challenges, and risks of corporate mobility not only for women but also for other individuals who are part of marginalized groups from different cultures and nationalities.

THE ROLE OF CHILDREN IN FAMILY TOURISM DECISION-MAKING IN EASTERN CONTEXT

— FROM A PARENT-CHILD JOINT DECISION-MAKING PERSPECTIVE

ABSTRACT

Background: Children's influence on their families will not be ignored or underestimated by the market due to their lack of income or being underage (Caruana & Vassallo, 2003). Literature on parent-child joint decision-making patterns mainly summarized and derived from western society (Jenkins, 1978; Therkelsen, 2010), such as authoritative parenting, counselling parenting, demographic parenting (Carlson & Grossbart, 1988). Although in Eastern contexts, parental reverence and obedience used to be emphasized (Zhang & He, 2021), many young Chinese parents exhibit their great willingness to treat their children with equality and respect in child-related decision-making process.

Purpose: This paper aims to investigate the impact of children on parent-child joint decision-making in family tourism context, and identify the main parent-child decision-making patterns and key factors therein from a modern Eastern family perspective.

Methodology: A mixed methods were adopted in this research, which combined in-depth semi-structure interviews among parents and their minor children (3 to 15 years old) and online questionnaire surveys, to deeply analyze and examine the interactive and communicative process and factors involved in parent-child decision-making in family travelling and more general contexts.

Table 1. Research steps

Phrase	Measurement method	Analysis method
Phrase1	Qualitative interview (towards parents and Childrens)	Thematic analysis
Phrase2	Questionnaire Survey (towards parents)	descriptive statistics, factor analysis, and structural equation modeling (SEM)

Findings: This research illustrates that: (1) In the Eastern context, children are often attributed with the “hope” and “future” of the clan, which makes Chinese parents willing to invest more resources in nurturing their children as opposed to themselves, and it exhibits child-centered characteristics in parent-child travel, even at the expense of their own preferences. (2) Due to the compensatory psychology and more scientific educational philosophy, modern Chinese parents place a high value on their children’s emotional well-being and the independence of children. Children are increasingly empowered and encouraged to participate in family decision-making, especially in child-related contexts like family holiday, where child is almost the most decisive member and the tasks undertaken by parents change dynamically according to the abilities and demands freely made by the children. Parents tend to act as supporters to fill in the parts of the decision-making process that the child is not involved in, but the freedom of children is still subordinate to the permission of parents. (3) Parent-child traveling is regarded as the condition that could develop children’s practical skills and increase their insights, and parenting patterns, children’ past decision-making experience, independent ability, knowledge-gathering, and persuasive abilities all affect children’s role in parent-child tourism decisions.

Research implications: The paper provides new insights on children’s impact towards parents’ decision and the final family tourism decision, and by focusing on the impact of minor children within Eastern family, this paper constructs a parenting-child decision-making pattern for Eastern families, contributing to the prevailing theories centered around Western society.

Keywords: consumer behavior, children’s influence, family holiday, parent-child joint decision-making, cultural difference

INTRODUCTION

This paper aims to investigate the impact of child on parent-child joint tourism decision-making. In-depth interviews and questionnaire surveys were conducted to deeply analyze and examine the interactive and communicative process and factors involved in parent-child decision-making in family travelling and more general contexts. The paper provides new insights on children’s impact towards parents’ decision and the final family tourism decision, and also contributes to the prevailing theories centered around Western society.

NAVIGATING THE POST-COVID LANDSCAPE: ADDRESSING HUMAN RESOURCE SHORTAGES IN THE LUXURY TOURISM MARKET WITH BRAZIL'S RADIX PROGRAM AS AN EXPERIMENTAL STUDY

Alan A. Guizi

São Paulo, São Paulo, Brazil

Summary: COVID-19 introduced new challenges to the tourism market, notably the scarcity of qualified employees following layoffs essential for company survival. Consequently, this study aims to explore and advocate for the training and preparation of travel designers in Brazil's post-pandemic luxury tourism market through collaboration with key companies in this sector. Methodologically, the study adopts an action research approach, highlighting the outcomes of collaborative efforts among stakeholders to develop a course that qualifies travel designers to cater to high-end clients. It also promotes lifelong learning, employability, and cooperation.

Key words: Meta-hospitality. Experienscape. Luxury Tourism Market.

1. Introduction

This study draws on the concepts of meta-hospitality, experiencescape, and the global challenges posed by COVID-19, which has significantly impacted tourism through border closures, personal care policies, social isolation, and temporary business shutdowns, among other effects.

Conversely, as the pandemic waned, tourism faced new hurdles. The mass layoffs meant that tourism agencies lacked enough staff to maintain customer service and relationships at expected levels. Moreover, new hires often lacked the necessary skills and knowledge to cater to the evolving demands for new destinations and tourist experiences.

In response, the Radix Program emerged, grounded in Hospitality concepts, and facilitated by the collaboration of four key companies in the Brazilian luxury tourism market. This program involves supporters, sponsors, and educators who deliver content to train aspiring travel designers, equipping them for this sector.

The authors of this study have actively participated in designing and developing the Radix Program from its inception, aligning the methodological approach with action research. Throughout this process, they applied the four phases of the basic action research cycle (Tripp, 2005) as a methodological framework.

The primary aim of this study is to explore and enhance the training and preparation of travel designers for Brazil's post-pandemic luxury tourism market, working in concert with pillar companies from this sector.
This paper also reviews the theoretical underpinnings related to meta-hospitality, experiencescape, and the broader impacts of COVID-19 on tourism, particularly in Brazil, highlighting the industry's need to train new employees capable of meeting and exceeding the evolving travel expectations of customers. Lastly, it discusses the methodological procedures and outcomes of the action research.

2. Theoretical foundation

2.1. Meta-hospitality and experiencescape

The initial studies on hospitality draw from French philosophical, anthropological, and sociological texts, which embrace a giving paradigm that circulates within society, independent of the market or State, nourishing social bonds (Camargo, 2004; Mauss, 1966).

Researchers analyze hospitality across three domains: social, private, and commercial. These include culturally rich public spaces, domestic environments or a host's home, and business settings between an employee and a client. The pleasure derived from helping or welcoming others, reciprocated as a social obligation, underscores hospitality as a reciprocal relationship between individuals (Lashley, 2004; Selwyn, 2000; Telfer, 2004).

Lashley et al. (2007) argue that as a sociocultural phenomenon, hospitality mirrors societal norms, values, beliefs, and ideologies, serving as a gauge for social order and disorder. This perspective highlights that genuine, spontaneous hospitality fosters generosity, kindness, benevolence, zeal, and public welfare.

Hospitality emerges as an inherent, ubiquitous trait in humans, manifesting in individuals who exhibit hospitality without expecting any reward or reciprocity. In commercial contexts, hospitality involves moral virtues guiding employees to engage in activities that demonstrate generosity, kindness, and empathy (Lashley, 2015; Telfer, 2000).

Hospitality invites various analytical approaches and explorations of different structures and configurations, potentially noticeable at institutional levels or in everyday experiences (LYNCH, 2011). Lugosi (2008) contends that commercial transactions involving shelter, food, drink, and entertainment provision create emotional states distinct from rational hospitality manifestations. He distinguishes hospitality as a tool for achieving social or political goals, termed meta-hospitality.

Meta-hospitality represents community moments that foster short-term emotional connections. In such settings, commercial spaces enable interactions among all participants, not just between hosts and guests but also among peers, briefly relieving the host of their authoritative role to allow others to welcome (Lugosi, 2008).

In meta-hospitality, the environment's hospitable characteristics are crucial for shaping interactions between guests. Here, hospitality is a means to an end, not an end itself, aiming for mutual recognition and acceptance without judgment, thus enhancing emotional experiences (Lugosi, 2008, 2009).

Emotion is central in guest interactions within meta-hospitality, ensuring the authenticity of hospitality, free from rational judgments, albeit ephemeral. Lugosi (2008) notes that hospitable spaces come alive in the social encounters among consumers.

Lynch et al. (2021) suggest expanding the focus of hospitality studies to view hospitality as both a condition and effect of social relations, spatial configurations, and power structures. They emphasize 'hospitality as work' in critical hospitality studies, focusing on the dynamics not only between guests and hosts but also among employers, employees, and coworkers.

Thus, to deliver exceptional services and create memorable experiences for all organizational stakeholders, it is crucial to focus on the interrelationships among all parties involved, promoting an interdisciplinary approach to fully understand all existing dimensions (Pizam, 2020).

Such relationships, aimed at fostering welcoming and human warmth within the commercial realm, pave the way for creating memorable experiences. Customers perceive them through the influence of the physical environment and functional and sensory issues, complemented by social interactions, cultural exchanges, and contact with diversity and natural elements that define experiences known as experiencescape, indicating a multisensory and multi-stakeholder approach (Pizam & Tasci, 2019).

From this inclusive perspective, the authors assert that five stimuli within a hospitality culture can shape a cognitive, affective, and behavioral experience, either positive or negative, for all stakeholders involved in service provision, product production, brand construction, or organizational management across various sectors (Pizam & Tasci, 2019).

Linking Lynch et al. (2021) and Pizam and Tasci (2019) highlights the need for hospitality research to broaden its scope beyond the consumer perspective, encouraging researchers to consider the broader array of stakeholders involved in hospitality.

Pizam and Tasci (2019) advocate for multidisciplinary empirical studies integrating marketing, human resource management, communication, psychology, and related fields focused on the experiencescape concept with a multi-stakeholder approach. This integration will enhance our understanding of the dynamics in service delivery environments.

This theoretical framework explores hospitality, meta-hospitality, experiencescape, and the luxury tourism sector, emphasizing the critical role of front-line employees who are essential in shaping customer interactions and the success of these initiatives.

2.2. COVID-19 and the challenges to tourism in Brazil

In 2020, the World Health Organization declared a highly transmissible new disease as a pandemic, which had resulted in 769 million confirmed cases and 6.9 million deaths by August 2023 (Barroso, 2020; World Health Organization, 2023).

Beyond its health impacts, the COVID-19 pandemic triggered a global economic recession as companies began to temporarily shut down due to decreased demand or the need for health precautions. This extended period of protection led to permanent closures and/or mass layoffs, significantly impacting society (Barroso, 2020; Matta et al., 2021).

In the tourism sector, international arrivals plummeted by 72% compared to 2019, and by 2023, global recovery had not yet reached 100%. In Brazil, the decline in international arrivals exceeded 65% in 2020 and 88% in 2021 (Embratur, 2023; United Nations World Tourism Organization, 2023a).

Contagion containment measures worldwide directly impacted travel and tourism, including border closures, mandatory quarantines for entry, testing requirements, and mandatory vaccinations when available (United Nations World Tourism Organization, 2023a).

As one of the hardest-hit markets, the global tourism sector lost about sixty-three million jobs in 2020. Specifically, in the Brazilian market, the loss was 400,000 jobs, though recovery gradually occurred in the following years (Statista, 2023; United Nations World Tourism Organization, 2023a; Vieira, 2021).

From March 2020 to May 2023, when the World Health Organization ended the global pandemic emergency, tourism organizations advised customers to reschedule or rearrange their trips with domestic destinations in mind, leading to new tourism models or interests that generally involve nature and more personalized or individualized experiences (Brasil, 2022; Organização Pan-Americana da Saúde & World Health Organization, 2023).

The return to normality in travel and tourism is happening gradually, with projections indicating that markets, like Brazil, will reach pre-pandemic levels by 2023, already showing real revenues 6.1% above those levels (Cedeño, 2023; Panrotas, 2023; United Nations World Tourism Organization, 2023b).

In the context of luxury tourism, which primarily focuses on quality of life, cultural enrichment, and experiential luxury, the Brazilian market has seen a faster recovery compared to other segments, driven by a demand for more exclusive trips that foster greater family connections and accommodate leisure, well-being, and social distancing, with revenues exceeding 50% in 2021 (CNN Viagem & Gastronomia, 2022; Iloranta, 2019; Sebrae, 2023).

Regarding changes in habits throughout the pandemic, Amadeus (2023) predicts that travel and tourism will pursue a more experiential and individualized path, yet with open borders, the sector will become more influenced

by technology and social networks, highlighting a demand for professionals trained to better guide clients in choosing trips, destinations, and itineraries.

Despite this market's resurgence, the mass layoffs during the pandemic have created a gap in qualified professionals in the global tourism market, as those who previously lost their jobs have now moved to other sectors without the expectation of returning to their former roles (Brito, 2022; Redação Terra, 2023; Revista Hotéis, 2022; Škare et al., 2021; Vieceli, 2022; Vieira, 2021).

In Brazil, which lost around 397,000 tourism jobs in 2020 alone, the new contingent of hires had already exceeded pre-pandemic numbers by 5.5% in 2023, totaling 3.39 million formal jobs linked to tourism. Although the sector has resumed hiring, it still needs to enhance the qualifications of its new hires, and even with hiring surpassing pre-crisis levels, the Brazilian tourism revival still requires more hiring (Brito, 2022; Vieceli, 2022; Vieira, 2021).

The necessity for qualified tourism professionals or those seeking to work in this field is not new, as concerns were already apparent before COVID-19, prompting the Brazilian Ministry of Tourism to develop online training programs, starting with the hosting of major events like the 2014 World Cup and the Olympics in Rio de Janeiro in 2016 (Lohmann et al, 2022).

With these needs particularly highlighted post-pandemic, the travel and tourism agency and operations sector in Brazil recorded about 48,000 active vacancies in June 2023, where companies themselves are preparing to conduct training for their contractors (Brito, 2022; Redação Terra, 2023; Vieceli, 2022).

The demand for qualified professionals aims to meet new customer expectations that have increased during the years of the pandemic, seeking personalized trips and experiences, and thus requiring more in-depth knowledge about destinations and various activities, with preparation for relationship building and service connected with the main market trends (Amadeus, 2023).

Through this study, we aim to understand the training and qualification efforts for the luxury tourism market through the Radix Program, an initiative of four companies in the sector in Brazil, designed not only to qualify individuals but also to potentially employ them at the end of their respective courses.

3. Methodological procedures

This qualitative and exploratory study employs action research, a participatory and experimental approach first outlined by Lewin (1946), where researchers actively collaborate with participants to enhance practices, processes, or knowledge in specific contexts.

In this study, researchers actively participated in creating and developing the Radix Program, with a unified goal of training and preparing professional labor to meet the evolving needs of customers in the luxury segment, amidst

the rapid revival of the Brazilian tourism market. They followed the four steps illustrated in the accompanying figure.

Accordingly, considering the four proposed phases, the study initiated the first sessions of the Radix Program in August and September 2023, with classes concluding in October and November of the same year.

Table 1: Action research phases and actions adopted.

Phases	Actions
Act to implement the desired improvement	• Promotion of relationships between pillars and stakeholders for the development of the Radix Program.
Monitor and describe the effects of the action	• Participation of researchers as content curators and moderators in all class sessions • Weekly feedback meeting with program pillars
Evaluate the results of the action	• Presentation of activities to a panel made up of pillars, stakeholders from the luxury tourism market, and teachers. • Perception of evolution in students' repertoire and knowledge
Plan an improvement in practice	• Application and improvement of observed results and feedback obtained in ongoing classes and subsequent classes. • Promotion of relationships between stakeholders to continue the program and increase reputation and accreditation in the market.

Source: The authors, adapted from Trip, 2005.

In the Radix Program, the practice of action research involved the authors actively participating throughout the initiative's creation and support process, in collaboration with the program's pillar companies. Once classes began, the authors were responsible for contacting stakeholders from the luxury tourism market who served as sponsors or supporters, organizing their class sessions with students, and assisting in the preparation of materials.

During class sessions, the researchers also engaged as moderators, facilitating enhanced dialogue between students and speakers, and aiding in the presentation of content. They implemented improvements to the course and class themes based on feedback from the pillar companies, promoting classes on topics deemed necessary. We consistently applied these changes to subsequent classes as well.

At the course's conclusion, students undertook an activity to create tourist itineraries for fictitious clients, aimed at assessing their content comprehension and knowledge development regarding the luxury tourism market. Successful participants received a certificate, and we discussed details in the following section.

4. Result

Considering the steps established in Tripp (2005), we subdivided the results section into four subsections describing related topics, according to the actions and measures adopted.

4.1. Act to implement the desired improvement: The Radix Program

As consumer behavior shifted towards less-explored or non-mass destinations during the COVID-19 pandemic, the demand for exclusive and individualized trips surged with borders reopened, and sanitary measures, relaxed. This demand highlighted the acute shortage of professionals in the field.

Recognizing these challenges and the difficulties in preparing professionals for a competitive market that demands extensive knowledge of tourist destinations, travel organizations, and sales, four leading companies in the Brazilian luxury tourism market joined forces to develop a course aimed at training such professionals. They also considered the possibility of hiring students after completing the course, thus creating the Radix Program.

The four founding companies of the Radix Program, referred to as 'pillar companies' to maintain their privacy, are:

- Pillar 1: Established in 2003, this company pioneered knowledge trips in Brazil, offering thematic itineraries in small groups led by experts in various fields. Its portfolio includes personalized trips, private jet expeditions, and global tours on private planes.
- Pillar 2: This leading Brazilian company specializes in crafting personalized, rare, transformative, and unforgettable experiences through the culture and nature of diverse global locations.
- Pillar 3: Known internationally for premium and luxury experience tourism, this 100% carbon-free Brazilian agency, founded in 1988. It operates in seven different areas including leisure travel, white-label agency services for high-end credit cards, concierge, MICE, operator services, an independent seller program, and publishing with Brazilian publisher Panrotas.
- Pillar 4: With over 30 years in the tourism market, this agency specializes in creating personalized and meaningful high-end travel experiences worldwide, tailoring itineraries based on the interests, desires, and needs of each client.

The Radix Program aims to train travel designers who are responsible for meticulously planning high-standard personalized trips, considering cultural and natural aspects for clients seeking authentic and striking experiences in exclusive, sometimes little-known destinations. The program incorporates accommodation, transportation, and on-site support services that ensure an important level of comfort and safety.

Due to the extensive market experience of the pillar companies and the recognized need for qualified professionals in the luxury tourism market, eighteen sponsors joined the initiative. This collaboration extends the program's reach in travel services and offers a broader spectrum of destination and service approaches, allowing the program to launch with significant industry recognition.

The Radix Program offers both theoretical and practical classes. Theoretical classes provide a foundational understanding of tourism, especially useful for beginners, covering topics such as the nature of tourism, segments of the tourism industry, concepts of luxury tourism, luxury travel agency operations, and market dynamics.

Executives and directors of the pillar companies and professors with advanced degrees and experience in tourism led those classes.

Practical classes shared by the program's sponsors, gave students direct contact with directors, presidents, and executives. Through these classes, students gain expertise in specific areas of operation and insights into the respective companies, covering topics such as car rental, airline ticket sales, luxury hotel bookings, travel insurance, cruises, and other daily marketing subjects.

Tourist destinations commonly marketed or sought after by clients of the pillar agencies are also discussed, highlighting areas in Brazil, the United States, Mediterranean Europe, Eastern Europe, Africa, the Middle East, East Asia, Southeast Asia, and Oceania, shared by sponsors operating in these regions or by training representatives of the Radix Program's pillar companies.

Additional topics like traveling with children, ski trips, gastronomic journeys, travel checklists, applying artificial intelligence in luxury tourism management, trends in tourism and hospitality, unconventional travel, and luxury as a business are taught by directors and CEOs of the pillar companies and by speakers and experts from the Brazilian and international luxury tourism and luxury market scenes, who are invited to join the initiative.

Associations and market entities are also involved, meeting with students to discuss their operations and roles, including organizations such as the Brazilian Luxury Travel Association (BLTA), Leading Hotels of The World (LHW), and Virtuoso.

4.2. Monitor and describe the effects of the action.

During the second class, we noticed that the students did not share the same level of knowledge about tourism and the role of a travel designer. This discrepancy required us to revisit basic topics in the theoretical classes. We also asked instructors, who are representatives of the sponsoring companies, to include introductory topics about the day-to-day operations of their industries in each session. This approach helped to level the knowledge base, enabling all students to advance together in their learning.

Conversely, the first group demonstrated an advanced understanding of daily activities and tourism. Students had previously studied tourism in university courses and had relevant work experience within their respective companies. This background created a disparity in objectives and needs between the groups.

Students in the first class also expressed the need to organize class themes into blocks, such as scheduling classes covering the same subject or tourist service segment during the same week or on consecutive days. Unfortunately, we could not fully accommodate this request due to the varying schedules of instructors and sponsors, who often needed to reschedule or cancel classes for professional reasons. This situation led us to seek other instructors, sometimes on different topics, to maintain the daily class schedule.

Additionally, both classes faced challenges with afternoon sessions. Various personal or professional commitments hindered students' ability to fully focus or attend these sessions. This was due to ongoing customer service responsibilities during class times or other external commitments that led to absences.

4.3. Evaluate the results of the action.

At the end of the program, students, organized into groups of up to four, undertake a non-evaluative exercise where they draw fictitious clients with specific travel requests and tourist itineraries. The students then apply their knowledge by creating a written travel itinerary, which they must present in person and orally to an audience comprising professors, directors of pillar companies, and program sponsors. This presentation fosters professional relationship building and networking among participants.

The Radix Program commenced in August 2023 with two cohorts. The first class consisted of twenty-seven students, all employees from the four pillar companies. This setup not only aimed at training and preparing them for the challenges of their roles but also served as a pilot test to identify aspects of the program to keep or to improve, based on weekly feedback meetings with students and their managers.

Classes for the second group started in September 2023 with a total of thirty-seven students. This group included four employees from each pillar company and four foreign scholarship holders from Afghanistan residing as refugees in Brazil. The selection of the other seventeen students considered applicants who lived in São Paulo and possessed advanced or fluent English skills.

Both groups attended classes from Monday to Thursday, with the first group meeting from 2 pm to 5 pm and the second group from 3 pm to 6 pm. The courses lasted three months, concluding in October and November for the first and second groups, respectively.

4.4. Plan an improvement in practice.

Considering the needs and experiences observed in the first two classes of the Radix Program, starting in 2024, the course extended to four months with classes held twice a week for each class. Additionally, students chose from three course levels at the time of registration, which were:

- Basic Level: Targeted at newcomers to the travel design profession or those with little experience in the market. Classes covered basic aspects of the profession, as well as popular destinations and services among high-end tourists. Sessions occurred for Mondays and Wednesdays in the afternoon from 3 pm to 6 pm; or on Tuesdays and Thursdays at night from 7 pm to 10 pm; or in a concentrated format on Saturdays from 9 am to 3 pm.
- Intermediate Level: Designed for professionals with over three years of experience in the tourism market. The curriculum included special occasions for clients like wedding trips, study abroad, and family celebrations, along with advanced services such as wellness, adventure and sports trips, culinary

excursions, cruise specials, and lifestyle elements of the luxury market. Classes took place on Mondays and Wednesdays from 7 pm to 10 pm.

- Advanced Level: Geared towards CEOs, directors, presidents, or businesspeople who had access to all content of the intermediate course, plus additional classes on people management, business plans, alliances and management, entrepreneurship, and guidance for professional development. These classes started in May 2024.

The selection of students for the new classes became more comprehensive, not limited to residents of São Paulo, but requiring at least an intermediate level of English proficiency, along with prerequisites specific to each level at the time of registration.

Upon completion, students not only could join the workforce of one of the program's pillar companies, but they also received course completion certificates. Despite the program's brief history, these certificates had gained significant recognition in the Brazilian tourism market as a pioneering effort in training travel designers and accelerating careers. Additionally, other companies in the tourism sector also could hire Radix graduates.

For advanced-level students, the goal was to foster innovation and entrepreneurship in the Brazilian tourism market, enhancing the quality of travel design services and overall tourist support for customers.

5. Conclusions

COVID-19 significantly impacted both the Brazilian and global tourism markets, leaving a legacy of challenges, including a shortage of employees and new hires who were unqualified to meet escalating customer demands.

The Radix Program, a collaborative effort among four luxury tourism companies in Brazil and the authors of this study, launched as a pioneering initiative with the goal of improving service quality and increasing the number of Brazilian travel designers in the market. This program united stakeholders with a shared interest in enhancing customer experiences and overall service value.

Throughout the theoretical foundation section, the concepts of meta-hospitality and experiencescape were crucial to the program's design. The program aimed to foster hospitality that transcended mere knowledge-based exchanges, striving instead to create emotional relationships, friendships, and existential exchanges that facilitated mutual intellectual growth among employees and students.

This study aimed to investigate and promote the training and preparation of travel designers for the post-pandemic Brazilian luxury tourism market through collaboration with key companies in the segment. It highlighted the importance of involving the entire stakeholder chain in high-end Brazilian tourism for training and qualifying not only new entrants and candidates but also established professionals. This involvement aimed to enhance personal and professional growth, encourage knowledge exchange, expand networking opportunities, and foster a sense of market belonging, thereby increasing confidence and autonomy in everyday professional activities.

Additionally, the study sought to understand individuals' intentions to continue their education and training as part of lifelong learning, a topic increasingly debated globally. The classes aimed to strengthen and deepen market relationships, building bridges among professionals at various levels of the production chain.

For future research, we will develop studies that emphasize cooperation among stakeholders aimed at qualifying and preparing employees for the market and the tourism and hospitality sectors, thereby enhancing understanding of the effects of such cooperation.

TOURISM EDUCATION IN SOUTH AFRICA: TEACHERS' INSIGHTS ON TEACHING TOURISM TO HIGH SCHOOL LEARNERS

Marcia Lebambo
Tshwane University of Technology
Pretoria, South Africa

Nicola Wakelin-Theron
University of Johannesburg
Johannesburg, South Africa

ABSTRACT

In 1994, South Africa underwent educational reforms that introduced a new curriculum, including subjects such as tourism, technology, and computer skills. In 1996, the Department of Education (DoE) added tourism as a formal school subject. This addition aimed to promote social transformation by preparing students for careers in the tourism sector and addressing past inequalities. Since then, capacity development programs have been initiated to align teaching with industry demands and upskill teachers. This paper provides insights into the factors that impact tourism teaching and learning in South African high schools based on interviews with 26 high school teachers in Gauteng province. The study identified three themes, grouped into inhibiting factors, including tourism discipline dilemmas, inadequate infrastructure and resources, and outdated education approaches. This research highlights the challenges and opportunities of teaching tourism in South African high schools and emphasises the importance of collaboration between the education sector and the tourism industry.

Key Words: tourism education, entrepreneurial skills, learners, teachers, high school, South Africa.

INTRODUCTION

Secondary schools and tertiary institutions worldwide are responding to the rapid growth of tourism and its economic potential by offering tourism-related programmes in their curricula. Tourism's multidisciplinary nature encompasses several jobs across industries. Tourism accounts for one in five new jobs created worldwide, with most employees being women, youths, and marginalised society groups (World Travel and Tourism Council [WTTC], 2019). Therefore, tourism teaching and learning have become topical among scholars and educators (Herman & Du Plessis, 2016; Kotler et al., 2014; Lebambo, 2019; Lebambo & Shambare, 2017). However, tourism research has been overly focused on its economic impact and neglected to assess tourism's broader role in developing critical inquiry, notably greater inclusion and independence of curricula (Caton, 2014; Mair & Sumner, 2017). This has led to a lack of clarity regarding what tourism students are learning and how (Mair & Sumner, 2017). Given the dilemmas and complexities of the tourism discipline, the place of tourism studies within high schools remains unknown despite tourism's recognition as a significant socioeconomic sector in South Africa. Thus, the paper aims to share insights into how teachers prepare learners for careers in the tourism industry. The study used the Gauteng province of South Africa as a case study. To this end, the following research question

guided the development of the arguments presented in this paper. **RQ1:** What challenges do teachers face in Gauteng high schools in preparing learners for careers in the tourism industry?

BACKGROUND

In South Africa, promulgating the Constitution (Act 108 of 1996) provided a basis for curriculum transformation and development (Department of Basic Education, 2003). The Constitution states that everyone has the right to primary education, including adult primary education, and to further education, which the state, through reasonable measures, must make progressively available and accessible. However, despite the progress in transforming the South African schooling system, several historical challenges remain prevalent in many public schools. Amnesty International (2020) highlights challenges such as crumbling infrastructure, overcrowded classrooms, and a lack of essential equipment (including furniture), learning tools and materials (including textbooks), laboratories, libraries, and sports fields. Some schools still do not have electricity and ablution facilities. The shortage of human resources and well-trained specialist educators is another major challenge (Chili, 2013; Velempini & Martin, 2019). The Development Policy Research Unit (DPRU, 2006) noted that schools also fail to provide adequate career guidance despite widely published realities about possible work for students in the tourism industry. Tourism has been identified as a distinct area within the high school curriculum in South Africa, and the Department of Education accredited it as an additional subject. The module aims to empower learners to understand the related services in the tourism industry and the interdependence of sectors and subsectors. If school leavers are looking for a career to enter without a degree, the hospitality and travel industry is open to those with the right attitude and commitment (Unkovic, 2017). Adukaite, Van Zyl, and Cantoni (2016) posit that education in information and communication technology (ICT) is an essential consideration in designing tourism curricula, as it is widely used in the tourism industry, and learners need early exposure to this field. This is particularly problematic in under-resourced schools, which lack the resources to invest in the required infrastructure. Furthermore, students in such schools show anxiety towards technology, lack training, resources (labs and devices) and experience, and resist using their mobile devices if they even have such devices with limited data availability. Within this context, the study provides insights into how students are being prepared for careers in the tourism industry by examining the challenges tourism educators face in various high schools in South Africa, together with the impact thereof on the success of tourism education.

LITERATURE REVIEW

Tourism academic dilemmas

There is no consensus regarding when tourism education emerged. Some suggest the 1960s, when several Tourism programmes were introduced with the development of technical and vocational schools in Europe (Tribe, 2006; Morgan, 2004; Airey, 2004, 2008). Nevertheless, several discipline dilemmas confront Tourism today, including what and how students learn about tourism (Mair & Sumner, 2017; Falk, Ballantyne, Paker, & Benckendorff, 2012). Critical scholars of tourism education argue that the multidisciplinary nature of tourism has weakened and fragmented tourism theory, derailing its development into a distinct discipline (Echtner & Jamal, 1997; Tribe, 1997; Taillin, 2014; Caton, 2014). Other scholars argue that tourism, being a relatively new field of study, has

contributed to it not being accepted as an independent academic domain, resulting in tourism scholars seeking academic credibility and independence (Tribe, 2006; Taillon, 2014). Cooper (2009) argues that the controversies and arguments are primarily due to the relative youth of the tourism education and learning domain. Another dilemma relates to knowledge about tourism. Tribe (1997) argues that tourism education still draws heavily from other disciplines, consequently remaining multidisciplinary and dependent on these disciplines. The epistemological domain of tourism comprises various domains (sociology, political science, economics, and more). The question is whether this truly reflects the reality of the tourism curriculum and practice, as these academic disciplines describe the external environment. For this reason, Tribe (1997, 2001) argued that what one knows about tourism is an epistemological question. In addition, the epistemology of tourism can help promote a systematic review of legitimate tourism knowledge and aid in setting the boundaries of tourism studies. Table 1 below provides a summation of dilemmas related to tourism.

Tourism education in South Africa

Despite a new wave of interest in tourism education in South Africa and abroad, a shared understanding of what constitutes tourism education in high school is still lacking, particularly in South Africa, where Tourism was introduced as a school subject in 1996. One of the dilemmas of tourism education in South Africa is that, while it is regarded as necessary from a practical and economic standpoint, it is also viewed as unimportant from an academic perspective (Dube, 2014). Dube (2014) asserts that this has placed tourism education in South Africa at a crossroads. Tourism in South Africa has been positioned as a critical sector for the transformation of the economy and redressing the injustices of the past when economic opportunities were not distributed equally amongst the country's citizens. Thus, teaching Tourism in schools and universities is aligned with the government's transformation agenda and is expected to stimulate domestic, regional, and international tourism and drive employment opportunities. However, there is a lack of research on tourism education in high schools in South Africa (Pawson, 2012; Van Niekerk & Saayman, 2013). Wakelin-Theron and Butler (2015) link this to South Africa's fragmented tourism industry, which contributes to the field of tourism education being relatively immature compared to more established disciplines. Maintaining Tourism as a school subject is a way of creating additional tourism awareness that could lead to students pursuing a career in the industry. During an industry launch with Sun International in 2017, the minister of Basic Education, Angie Motshekga, stated: "*Tourism is the one industry that attracts and absorbs skills across the board. It is a growing industry, and we must plan now so that the country is well-prepared to offer the very best products and services to compete effectively against other world-class, long-haul destinations in the near future".* In addition, it is critical to determine if a school is located in a tourism destination with a strong representation of major hotels and attractions and if leading industry employers recruit from schools within the geographical area. Tourism education influences learners' intention to continue such studies based on affective commitment (Ilban & Kash, 2015). McKeown and Lindorff (2011) observe that graduates have unrealistic expectations regarding the tourism industry and job market. Researchers have established that students view a career in tourism as glamorous, offering opportunities to travel, have a career in a foreign country, or work for large transnational companies (Richardson, 2010; Richardson & Butler, 2011; Aynalem et al., 2016). In addition, peer influence is the best predictor of students' choice of tourism careers (Anthony, Mensah & Amissah, 2021). Graduates may not realise that they will

be providing a service to various types of tourists in a volatile, unknown, complex and ambiguous (VUCA) world (Wakelin-Theron, Ukpere, & Spowart, 2019).

Teaching Tourism in High Schools in South Africa

Although tourism has been identified as a potential source of economic development in several developing countries, many countries cannot fully leverage this potential due to a lack of human resource capacity within the hospitality and tourism industry (Velempini & Martin, 2019). Chilli (2013) asserts that teaching needs to be lucrative and attractive and that Tourism educators require proper training to be competent, innovative, effective, and knowledgeable in their learning area. While the tourism industry faces extreme technological advances as the driving engine of improvement and productivity, many high schools remain resistant to teaching ICT strategies and tools to increase efficiency in the tourism industry (Daniele & Mistilis, 1999). Although most high schools in South Africa have computer laboratories, they do not have critical technology applications for the travel and tourism industry. Social science teachers welcomed the introduction of Tourism at the school level. Unfortunately, the government overlooked the shortage of qualified tourism teachers hampered high-quality teaching and learning (Chili, 2013). In addition, while tourism is considered an opportunity missed until now, education in South Africa was rushed to address the skills shortages and the high need for human resources (Chili, 2013).

THEORETICAL FRAMEWORK

Due to globalisation, advances in technology, and evolving consumer expectations, the tourism industry has become more complex and dynamic than ever (Stone, 2017). In accordance with this, teaching and learning the subject of tourism in this digital age is becoming increasingly complex. In conceptualising the teaching and learning environment necessary for the success of Tourism teachers and students of the 21st century, the connectivism theory of learning was utilised in the present study. It is a relatively new learning theory that suggests students should combine thought, general information, and theories in a helpful manner. Masethe et al. (2017) argue that while traditional educational philosophies such as behaviourism, constructivism, and cognitivism are the foundations of teaching and learning, Connectivism is based on the principle of connecting specialised information sets, which connection enables us to increase our current state of knowing. Some of the principles of this theory are that learning and knowledge rest in a diversity of opinions and that it is necessary to nurture and maintain connections to facilitate continual learning. This model of learning acknowledges that there are tectonic shifts in society, leading to learning no longer being an internal, individualistic activity (Siemens, 2005). This is supported by Alarcón and Bettez (2021), who argue that the new notions of classroom management require that teachers give up the role of sole authority and include various perspectives, such as a community-based learning environment. Siemens (2005) in Ravenscroft (2011), in an article on dialogue and connectivism, identifies eight principles of connectivism: 1) Knowledge and learning rest in a diversity of opinions; 2) Learning is a process of connecting clusters of information; 3) Learning may be present in non-human appliances; 4) Capacity to know more is more critical than what is currently known; 5) Fostering and maintaining connections are required to facilitate continuous learning; 6) The ability to see connection between concepts, ideas, fields, and essential skills is critical; 7) Up-to-date knowledge is the intent of all connectivist learning activities; and, lastly, 8) decision-

making is, in itself, a learning process. Ravenscroft (2011) posits that learning new information requires a lens of a shifting reality in time and space due to constant change in decision-making. Students who enter the uncertain world of work, particularly the fragile and vulnerable tourism industry, require different skills, implying that educational systems need to change radically to meet this need (Wallis & Steptoe, 2006). The demand for changes in the tourism curriculum is apparent, and educators need to support students in generating successful leaders for the future tourism industry (Elliot & Joppe, 2009). Students should not only learn theoretical tourism concepts but also become practitioners in the tourism industry by gaining skills related to technology (Cheung & Law, 2000; Sigala & Baum, 2003). Thus, in the present study, connective principles were employed to address the void in the literature on curriculum development to prepare students for today's tourism industry and enable them to thrive in this environment (Ravenscroft, 2011). This learning model was adopted in the present study to gain insights into the skills and tasks learners need to master to flourish in the tourism industry in a digital era.

METHODOLOGY

Research design

Qualitative data were gathered from individual in-depth interviews with a sample of high school teachers in Gauteng province. Participants were informed that their participation was voluntary and anonymous. Twenty-six (26) tourism high school teachers participated in the study. The in-depth interviews were used as a qualitative approach to gaining an in-depth understanding of social issues. The method was best suited to obtaining data from a purposively selected group of individuals with insights on the topic.

Qualitative case study methodology

A case study was chosen because the purpose of the study is to conduct an in-depth exploration of intricate phenomena within some specific context through various data sources and a variety of lenses in order to reveal multiple facets of the phenomenon (Baxter & Jack, 2008; Rashid et al., 2019). In the study context, this refers to an in-depth exploration of how teachers prepare learners for careers in the tourism industry. Specifically, looking into the challenges teachers face in Gauteng high schools in preparing learners for careers in the tourism industry. (Yin 2009) advises that a case study is applied when you want to cover contextual conditions because you believe they are relevant to the phenomenon under study. Concerning the study, these are contextual issues relating to the challenges high school teachers encounter in preparing learners for careers in the tourism industry.

Study population and sample

Sampling was opportunistic due to the availability and accessibility of the teachers in Gauteng high schools. The teachers were purposively selected because they are experts in the field. The selected teachers were better equipped than a probability sample and would have been able to enhance the quality of the research (Etikan, Musa, & Alkassim, 2016). This sampling method enabled researchers to identify and select groups of individuals who are knowledgeable about and have experience with the phenomenon of interest. In this case, tourism is taught as a subject in high schools, particularly public schools in the Gauteng province of South Africa. No incentives were

provided for participation. The teachers shared their perspectives and experiences concerning teaching Tourism as an academic subject in high school.

Research instruments and procedure

Researchers designed an interview guide to structure the discussions. The interviews, a hybrid design of face-to-face and online interviews using platforms such as Microsoft TEAMS, lasted between 40 and 55 minutes per participant; some were recorded with their permission. Participants were fully informed about the purpose of the study. The questions were divided into two categories: the first section focused on the challenges teachers face in preparing learners for a career in the tourism industry, and the second part focused on how Tourism learners learn about tourism.

Data analysis

The data analysis followed Yin's (2016) five-phased cycle of compiling, disassembling, reassembling, arraying, and concluding. The data were transcribed and analysed using a qualitative data analysis tool, ATLAS.ti, to enable thematic reporting of the findings. Both discourse and content analyses, using open coding and theme categorisation, were used in analysing the data.

FINDINGS AND DISCUSSION

The paper aims to share insights into how teachers prepare learners for careers in the tourism industry. The study used the Gauteng province of South Africa as a case study. To this end, the following research question guided the development of the arguments presented in this paper. **RQ1:** What challenges do teachers face in Gauteng high schools in preparing learners for careers in the tourism industry? In total, six themes emerged from the data. These are discussed under one distinct construct. The *Inhibiting factors*, which include three themes: (1) *Tourism discipline dilemmas*, (2) *Poor education infrastructure and inadequate learning resources*, and (3) *Dearth of the 21st-century education approach.* Table 1 below shows themes and sub-themes that emerged from the data alongside their constructs.

Table 1: *Themes that Emerged from the Data*

CONSTRUCT	THEMES	SUB-THEMES
Inhibiting factors	1. Tourism discipline dilemmas	Perceptions and misconceptions regarding the Tourism subject
	2. Poor education infrastructure, crime and inadequate learning resources	Overcrowded classrooms; Delays in delivery of learning materials and lack of ICT centres, libraries, and books Lack of internet connectivity, lack of electricity, stolen data cables, lack of data, lack of devices for students, lack of ICT technologies and laboratories

	3. The dearth of the 21st-century education approach	Tourism entrepreneurial skills; Digital literacy skills People skills: Confidence and communication

Inhibiting factors themes

Tourism discipline dilemmas

This theme emerged as one of the sub-research questions, which asks what and how learners learn about tourism in high school. The study found that, in South Africa, the Tourism subject has a low status in the curriculum, and university exemption is not a prerequisite for entrance to most university courses. This has contributed to the negative perception that Tourism is a subject with low academic status. In addition, it is perceived to be chosen by and recommended for learners with learning difficulties. Chilli (2013) corroborates these findings and raises concerns about the perception of Tourism as a school subject. His study found that teachers and learners perceive Tourism as an easy subject. However, Ray and Wakelin-Theron (2018) confirm that there is no existing culture in which tourism students can participate actively as tourists. Literature indicates contrasting reasons for studying tourism (Roberts, Andreasson, O'Donnell, O'Neill, & Neil, 2018). Tourism is labelled less academic than traditional subjects and is considered more vocational. (Caton, 2015). These contradictions acknowledge that the multidisciplinary nature of tourism education has weakened already fragmented tourism theory. The industry believes that Tourism as a subject is worthy of being included in the curriculum, as it will expose school leavers to various career opportunities through practical skills (Dube, 2014). However, difficulties arise when a new curriculum has to be designed and developed within a fragmented education system (Pieterson, 2015).

> *"Some of our learners think studying tourism means travelling every day… Another perception is that the subject is reserved for learners who are not smart and cannot do difficult subjects like Science"* (Participant 2, Quote 38).

> *"In our school, Tourism is compulsory, as we are an LSEN* [learners with special educational needs] *school, and we do not have a wide variety of subjects. However, as I understand from my colleagues, some learners take tourism because they want to pursue a career in it. However, sadly, some learners take Tourism because they cannot cope with another subject, for instance, Mathematics. Some learners think Tourism is an easy subject*" (Participant 8, Quote 17).
>
> *"Most learners are overly dependent on the teacher. They are reluctant to participate in class and unable to apply their knowledge and relate it to what they have been taught. They are not independent and proactive in doing projects and other assessments. They have never travelled and do not participate in tourism due to financial difficulty and mobility challenges"* (Participant 3, Quote 15).

Swart, Booyse, and Burroughs (2014), who investigated the Tourism Curriculum Assessment Policy Statement (CAPS), corroborate the sentiment contained in the above excerpt. Their report states that learners are often moved

to take the tourism subject because of the perception that it does not require the same commitment and diligence as what is perceived as more complex subjects. In this regard, Swart et al. (2014:14) state:

> *Most principals, teachers, parents, and learners do not understand that Tourism fits into the vocational subject cluster, better known as the practical subjects cluster, together with hospitality studies and consumer studies. While they accept that the latter two subjects require a commitment to practical time, they feel that Tourism is merely a desk-top subject and do not understand the additional time that has to be committed practically*.

The CAPS document does require that Tourism teachers incorporate the following in their annual planning: 1) Awareness of career opportunities, 2) Awareness of service excellence, and 3) General awareness of South Africa as a tourist destination – yet this is not part of their annual plan. Tourism is not an academic subject for university entrance, and this has been cited as another reason for perceiving tourism as a low-status subject (Dube, 2014). McKeown and Lindorff (2011) observe that graduates hold unrealistic or highly inflated expectations about the job market because of students' misconceptions about tourism. As a result, graduates' experiences at work usually do not match their expectations (Josuh et al., 2011; PwC, 2011).

Poor education infrastructure and inadequate learning resources

This was the second theme that emerged under *Inhibiting factors*. Sub-themes include *Lack of internet connectivity*, *Lack of computer laboratories*, *Delays in delivery of learning materials such as textbooks*, and *Overcrowded classrooms*. Using technology in the classroom improves instructional effectiveness, resulting in more significant learning and higher learner achievement. Technological facilitation facilitates active learning, essential in travel and Tourism subject delivery to help learners engage with the content. One of the aims of the South African Curriculum, according to the curricula assessment policy statement of 2011, is equipping learners, irrespective of their socio-economic background, race, gender, physical ability or intellectual ability, with the knowledge, skills and values necessary for self-fulfillment and meaningful participation in society as citizens of a free country (Department of Education, 2011). The study found that while other schools can access learning technologies such as smartboards and computer laboratories, others are still without, especially in the townships. Technologies in the classroom environment can improve engagement and increase learners' exploration of tourism offerings (Qiu, Li, Li, 2021). Thus, Hsu (2018) asserts that radical transformations are essential for the sustainability of tourism education. The latter author argues that conventional lectures can no longer satisfy learners' appetite for learning. Modern devices and constant information exchange have increased learners' expectations of learning on demand and their appetite for "edutainment". While others have the relevant learning technologies to enhance learning, they are too confronted with other challenges, such as crime, which has become rampant in South Africa. According to police-recorded crime statistics in 2022, the number of burglaries at schools reported in the Gauteng province was 329 for the first quarter of the 2021/2022 financial year (South African Police Service, 2022). Crime leads to some of these smart boards being taken off the walls and computer labs being broken into. This impacts the teacher's ability to incorporate visual reality in the classroom, which is essential, especially in the context of South Africa, where many learners and teachers have limited travel exposure.

Virtual reality can transport students to the heart of global tourist destinations; for instance, virtual reality (VR) and augmented reality (AR) technologies allow students to explore tourist destinations, historical sites, and cultural landmarks, thus enhancing their understanding of different locales and enriches their theoretical knowledge with practical insights (Mandalia, 2023).

> *"Without computer labs and internet access, learners cannot research the assignments we give them. They are also unable to visualise some of the attractions we talk about, because we do not have internet connectivity and* [we have] *limited additional teaching resources. Sometimes you want to show them a picture of Robben Island, Table Mountain…"* (Participant 5, Quote 19).

> *"As a teacher, having to teach Tourism with a lack of resources can be a problem, as tourism is a growing and changing industry. It always requires updated information, and if there is no internet, computers, printers, or photocopy machines, it can be difficult to deliver the correct content to learners because of a lack of support from the school and parents. This can create problems in class because if the school does not prioritise Tourism as they would with prioritising Maths and Science by allocating extra classes or extra time, it discourages a teacher in class from giving these learners extra time to do their best"* (Participant 5, Quote 18).

The educators stated that poor educational infrastructure negatively affects learners' stimulation of a travel culture. They observed that the learners are interested in the tourism system and would like to travel and explore the industry. This is evident in regular requests for excursions. However, many of the learners are from impoverished families and are thus unable to attend field trips organised by the school if they have to pay for them. In addition, poor educational infrastructure, which includes a lack of technology to visualise the dynamic elements of tourism, also hampers effective learning.

The dearth of the 21st-century education approach

The study found that industry-specific skill sets critical for the tourism sector are not incorporated into the curriculum. These include entrepreneurial skills, digital literacy skills, people skills, which will help learners interact with people from different backgrounds and cultures, and, more importantly, self-management skills such as confidence and communication. Some of these challenges are evident in the extracts below.

> *"Teaching is a challenging profession, requiring teachers to think and reflect. Excellent teachers do indeed have set tricks that they draw on. The challenging experience in the classroom is content knowledge. Students interact in the classroom using both internal and external learning skills and knowledge to understand the content. However, the challenge is when the knowledge has to be applied and implemented by writing assessments. Fifty per cent of students cannot relate to content"* (Participant 12, Quote 11).
>
> *"I am of the view that entrepreneurship skills need to become part of the curriculum so that they can open their own tour companies, restaurants, or spaza shops. I also think driving skills are essential, as*

it opens up more opportunities immediately; in some situations, good cooking skills assist with their nutrition. We as a group agree with computer literacy skills and feel that it is essential in the working world" (Participant 7, Quote 39).

Swart, Luka, and Donina (2014) note that knowledge, skills, and abilities are necessary to succeed and progress in the tourism industry, thus supporting these findings, and state that students highly value the knowledge they acquire and the skills and abilities they develop during their education. Li (2008), concerning entrepreneurial skills, notes that the proper knowledge, skills, and employability attributes are critical to social mobility and employment. However, South African educational institutions are experiencing significant problems related to high dropout rates and poor progression (Umalusi, 2014). The DPRU (2006) urges academic institutions to integrate 21st-century skills, such as entrepreneurial and communication skills, into the curriculum to meet the tourism industry's needs (Maher & Nield, 2005; Fidgeon, 2010). Digital literacies, including ICT and media literacy, have been emphasised as the pillars of 21st-century skills (Chen, 2015). Cheung and Law (2000) propose that students not only learn theoretical tourism concepts but become 'trainee practitioners' in the tourism industry by gaining skills in preparing, handling, and managing technology. Furthermore, the participants believed that students experience great difficulty grasping concepts and abstract content. Concerns in the industry have identified these issues. The majority of teachers stated that students have difficulty grasping any number of the following: exchange rates, sustainable tourism, the Triple Ps (people, planet, and profit), the traditional 4Ps (product, place, price, and promotion), time zones, the concept of iconic destinations around the world, and distance calculation. Figure 1 below illustrates the inhibiting factors.

CONCLUSION AND RECOMMENDATIONS

The overarching objective of this research was to share insights into how Tourism is taught in South African public high schools. While this paper recognises various teacher upskilling initiatives in collaboration with the Department of Tourism, universities, and the private sector, these should be customised to the needs of the Tourism curriculum. In particular, addressing 21st-century education requires a critical skill set for tourism learners: communication, collaboration with the industry, critical thinking, and creativity (Spowart et al., 2018). This study determined the skills of educators that need to be honed, such as digital mastery in tourism, tourism entrepreneurial skills, adaptability, cross-cultural skills, and critical thinking skills. From an educator's perspective, critical thinking skills would make education more creative, flexible, and challenging for learners, letting learners apply, analyse, evaluate, observe, experience, reflect, and communicate about the work. In addition, the use of industry liaison committees established in collaboration with schools offering Tourism as a subject will assist in ensuring that education meets the needs of the industry and the continuation of field trips, the benefits of which outweigh class learning. The continuation of career days related to the tourism industry is slowly changing perceptions of the tourism industry and creating greater awareness of the job opportunities it offers to those leaving school and those who would like to enter the tourism discipline. However, more effort should be made to foster collaboration between schools and universities offering tourism and the industry to affect a smoother transition from high school to university and inculcate the tourism culture, which has proven to be a mammoth task for teachers.

LIMITATIONS

Data were gathered from a limited number of participants in the province of Gauteng in South Africa; therefore, the findings may not represent tourism educators throughout the country. Future research could address this limitation and gather data over time to determine changes in participants' experiences and the tourism education field.

ACKNOWLEDGEMENT

The researcher would like to thank and acknowledge the tourism educators' willingness to participate in this study.

DECOLONISATION OF TOURISM CURRICULA IN HIGHER EDUCATION IN SOUTH AFRICA: WHAT DOES IT MEAN

Samantha C. Bouwer
Centre for Sustainable Tourism
Tshwane University of Technology
Mbombela, Mpumalanga, South Africa

EXTENDED ABSTRACT

In 2015, the South African higher education system witnessed a call for the decolonisation of higher education (and thus a decolonised curriculum), following the 2015 #RhodesMustFall and subsequent, #FeesMustFall student campaigns. According to Wingfield (2017), students were essentially calling for the current system to be overthrown, and rather defined by the people that the system is supposed to serve; or more explicitly, as Mgqwashu (2016) contends, substituting the works from the global North with African theorists and authors, thereby ensuring that African universities do not simply become mere extensions of former colonisers.

Subsequently, there has been a plethora of contributions, both conceptually and empirically, serving to advance the decolonisation debate. With regard to the former, conceptual and opinion papers have been presented by commentators such as Koopman & Koopman (2021), Le Grange (2021), Themane (2021), and Vandeyar (2019), for example. Empirical studies have essentially centred on the elicitation of key stakeholder perceptions such as students, lecturers and leaders. Contributions by Chinyamurindi (2023), Arday, Belluigi and Thomas (2021), Du Plessis (2021), Lumadi (2021), Mashiyi, Meda and Swart (2020), Meda (2020) and Mheta, Lungu and Govender (2018) are cases in point. However, there appears to be a paucity of literature pertaining specifically to the decolonisation of tourism curricula. Beyond the contributions of Everett (2023), Higgins Desbiolles (2020), Joppe, Shen and Veltri (2020), Hlengwa 2019, Young and Maguire (2016), and Chambers and Buzinde (2015), contributions are somewhat scant.

Tourism academics (as a key stakeholder) are generally responsible for the development and delivery of tourism curricula. The purpose of this qualitative study was therefore to explore the perceptions of decolonisation of tourism curricula as held by tourism academics in higher education institutions in South Africa. Given the sensitive nature of the study, data were collected by means of an online, open-ended survey, with a view to encouraging 'free-writing', whereby responses would be anonymous and free from the potential bias that may have arisen in an in-person, face-to-face interview.

Semantic and inductive thematic analysis was undertaken on responses elicited from 18 participants. This involved the analysis of explicit content (as opposed to reading into the subtext and assumptions), whereby themes were data-driven rather than approaching analysis with preconceived themes. Following researcher immersion in the data, manual coding was undertaken which involved the allocation of codes to chunks of text in relation to the research question. Once all the text had been coded, patterns among the codes were identified, resulting in theme generation.

Six key themes were generated from the data including, complexity, independence, stakeholder collaboration, dynamic transformation, contextualised knowledge, and multilingualism. In essence, 'decolonisation of tourism curricula' is considered to be a complex, multi-stakeholder informed, and on-going, transformative process (as opposed to end state). It was widely acknowledged and understood as a curriculum that is transformed in order to better represent the South African context – the histories, knowledges, values and importantly, the unique

South African tourism products. It is a curriculum that does not necessarily reject 'Eurocentrism' but rather moves towards an 'Afrocentric' approach. It is an authentic curriculum that promotes the message of being 'proudly South African' and considers the use of indigenous languages in teaching and learning.

However, a decolonised curriculum (i.e. an education that differs from the rest of the world) was questioned in regard to its utility in producing globally-competitive graduates. Important to note was that some participants openly reported a limited understanding of decolonisation having, to date, not given it due attention or consideration.

This exploratory study therefore contributes to the extant literature on the decolonisation of curricula in higher education through offering preliminary insights of a key stakeholder in a specific discipline. Whilst it is acknowledged that this was a qualitative study gleaning insights from a small sample of tourism academics, it perhaps serves as a foundation for igniting the conversation among tourism programme teams, with a view to considering (and agreeing) on how tourism curricula, teaching and learning can be transformed in order to foster inclusivity and diversity.

Key words: decolonisation, curriculum, tourism, higher education, South Africa

BRIDGING THE GAP BETWEEN THE EVENT INDUSTRY AND GRADUATES FROM A UNIVERSITY OF TECHNOLOGY

Lisa Welthagen

Tshwane University of Technology

Centre for Sustainable Tourism

Pretoria, South Africa

ABSTRACT

This study identifies a critical need to address this challenge by investigating the competencies required in the tourism industry, specifically the event sector, and the perception of work readiness by event management graduates. The study adopts a qualitative approach with interviews conducted by 17 industry representatives who indicated the expected competencies and skills, challenges, and recommendations to close the gap between industry needs and higher education institutions' offerings. Findings from the data facilitated an in-depth understanding of the skills and competencies expected in the event industry in South Africa and the challenges thereof.

Key Words: Skills, Competencies, Higher Education, Curriculum, Employer, Work Readiness.

INTRODUCTION

One of the main goals of bridging or closing the gap between higher education (graduates) and industry is to establish initiatives where curriculum design links educators in higher education and industry which establishes the necessary skill sets and knowledge for graduates to work in the industry (McCartney & Kwok, 2022) since higher education needs to ensure that students have the necessary skills to enter the world of employment as young graduates struggle to find work that matches their skills (Uffindel, 2017; Zeidan & Bishnoi, 2020). The focus, therefore, lies on aiming to close the gap by connecting curriculum design with academics and the industry to prepare the students adequately for the needs of the workplace (Alhelalat, 2015; McCartney & Kwok, 2022; Uffindel, 2017).

In the context of South African higher education, a disjuncture between higher education graduates and the 'world of work' (the industry) exists. Technological Higher Education Network South Africa (THENSA) admits that there has been a displacement between what is happening in Higher Education and what is happening in the industry (THENSA, 2022). In the current form, many higher education institutions in South Africa offering tourism and event management qualifications require students to complete a three to six-month credit-bearing Work Integrated Learning component (THENSA, 2022). This study aims to create an in-depth understanding of the skills and competencies expected in the event industry in South Africa the challenges faced and how there can be improved collaboration between industry and higher education for the benefit of graduates.

LITERATURE REVIEW

It has been discovered that cooperation and partnerships between higher education and the tourism and hospitality sectors are essential to creating a knowledge-based economy (Sobaih & Jones, 2015). Yet, there is an ongoing tension to balance theory with practice, to have the skills and knowledge required by students upon graduation to work in the tourism and hospitality field (Ruhanen, 2005; Uffindel, 2017). One principal aim of bridging or closing

this gap is to create actions where curriculum design connects educators and industry, thereby helping prepare students adequately with the skills and knowledge sets needed for a career in the hospitality industry (Alhelalat, 2015). The fundamental presumption held by policymakers is that Higher Education should have a significant impact on society and assist with job creation and growth (Suleman, 2016). As a result, Higher Education institutions should be conscious of the demands of the economy and adapt their curricula accordingly (Suleman, 2016). However, Chi and Gursoy (2009), state that if there is "a relevant, up-to-date industry curriculum, graduates are likely to possess the knowledge and skill sets required for a successful career". The capabilities that employers and recent graduates of higher education need have changed due to recent changes in the labour market. Employers, specifically in the tourism and event industry require staff that are creative, innovative, able to problem solve, work in teams, manage their time and have good communication and presentation skills (Karaca-Atik, Meeuwisse, Gorgievski & Smeets, 2023).

Although higher education encourages graduates to have a more holistic thinking, the industry requires twenty-first-century skills to integrate and balance work and life after graduation (Karaca-Atik *et al.,* 2023). These skills are developed to assist students with gaining employment in the industry, especially the events industry which requires personal attribute skills such as innovation, creativity, problem-solving skills etc (Karaca-Atik *et al.,* 2023). In addition, they are also required to possess social and cross-cultural skills to collaborate with people from different backgrounds (Chi and Gursoy, 2009; Doughty *et al*., 2019). Wider literature has provided evidence that possessing 21st-century skills is essential for maintaining a sustainable career (Karaca-Atik *et al.,* 2023). However, studies conducted in many countries consistently indicate that there is a wide skills gap in higher education graduates (Tran, 2018) which initiates the call for higher education institutions to improve the quality of teaching and skills training to better equip graduates for the industry.

Increasing awareness of the necessity of continuing to train event management experts is emerging as the number of events rises and the discipline of event management develops (Arcodia & Reid, 2002; Arcodia & Barker, 2003). Hiring graduates with relevant training and experience can satisfy several objectives and will assist in sustaining the delivery and professionalism of high-quality events (Arcodia & Barker, 2003). Knowledge and skills can be theorised and learnt however personal attributes are synonymous to the personal characteristics of a graduate and represent the qualities such as traits, values and attitudes of a person. These attributes are more difficult to develop however essential in the execution of an event. In a study conducted by Perry, Foley and Rumpf (1996), ten predefined knowledge attributes were highlighted as important for the event industry. These included legal/financial knowledge, management knowledge, public relations and marketing knowledge, economic knowledge, and contextual knowledge. The essential personal attributes of a good event manager were identified as vision, leadership, adaptability, high organizational skills, good communication skills, marketing skills and people management skills.

METHODOLOGY

This study adopted a convergent mixed methods design in which the quantitative and qualitative data were collected simultaneously and analyzed separately. For this study, only the qualitative results will be discussed. A qualitative methodology was deemed the most appropriate to understand the event industry's expected competencies and skills of event management graduates, the challenges experienced and the recommendations to close the gap between industry needs and higher education institutions' offerings. In-depth, semi-structured interviews were conducted with industry stakeholders/practitioners (Professional Conference Organizers (PCO) – O1-O12, academics A1- A4 and event associations EA1 to elicit their attitudes, opinions and experiences of event graduates in the industry. The industry practitioners interviewed had mentored, supervised or taught event management graduates from a University of Technology who were either completing their Work Integrated Learning component or currently employed in the industry. Seventeen interviews (after saturation) were conducted were conducted using Microsoft Teams due to the geographical dispersal. The interviews were recorded and transcribed with written and signed permission from the participants. Ethical clearance for this study

was approved through the ethics committee. The interviews were approximately 20 to 30 minutes in duration. The interviews encouraged the participants to speak freely about their expectations and experiences and the data would be generated from the industry practitioners' own words. The three main questions answered by the participants included:

- What are the main skills and competencies required for the event industry?
- What challenges were encountered by the event management graduates?
- How can these challenges be overcome and the gap between higher education and industry be closed?

A thematic framework was utilized to identify the key topics (themes 1 – 3).

INTERVIEW FINDINGS

The analysis revealed three key themes reflecting the event industry's perceptions which included employability skills and competencies required by graduates to gain employability and work readiness in the event industry, challenges encountered by the industry and overcoming the challenges and closing the gap.

To identify and determine if graduates are "work ready" for the events industry, it was important to investigate the skills and competencies that the industry deems essential to gain entrance into the industry. The complexity surrounding the industry's needs was put forward and there was consensus amongst the industry practitioners that there are a diverse set of skills required to enter the event industry of which many of these falls into the domain of personal attributes which are not usually included in the curriculum of Higher Education in South Africa.

Employability skills and competencies (theme 1)

Participant's findings indicate that it is important for graduates to not only possess professional competencies but also methodological, social and personal competencies. *Professional competencies* (theoretical knowledge) Holding of knowledge relating to the latest industry standards and paradigms – the foundation for being able to work and solve problems in a company. *Methodological competencies* - transfer of theoretical knowledge into real application-based problems. Applied knowledge, social skills, problem-solving, planning, skills, continuous improvement and project management skills are often expected. *Social competencies* – being able to deal with people, communication, teamwork, conflict management and interdisciplinary communication are expected. *Personal competencies* - Self-discipline and positive work attitude as well as presentation skills and the ability to learn new things.

Challenges experienced by industry, academia and association practitioners (theme 2)

To better understand the challenges that the industry experiences with event management graduates, the participants were asked to reflect on their experiences with higher education graduates. Issues relating to poor personal attributes were consistently identified both in the literature and by the participants.

Participant EA1 indicated that *"many graduates feel entitled and once graduated feel that they know it all and should not be starting at lower levels but should be offered management positions", furthermore there is a huge mismatch between expectations of employees and employers".*

Participant O9 indicated that many of the students battle to grasp the adaption of theory to practice, struggle with time management and adjust to the long hours demanded by the event industry. Participant A2 indicated that many of the graduates (students) lack responsibility and time management and often hand in assignments late, their communication skills are poor (this could be due to their cultural backgrounds) and have the inability to work as a team. Furthermore, indicated that there is a lot of "*babying*" going on. The students resist teamwork and do not want to participate. Participant O5 felt that "*students struggle to balance work time and personal life due to the long hours expected by the events industry".* Participant O6 raised concerns that "*the industry is moving at a very fast pace and there is no time to spend hours training students to get them up to speed with what is happening in the industry".*

There was consensus amongst some of the participants that we are also seeing the effects of COVID and the students that have come through the online system with very little practical and application experience which is extremely important in the events industry.

Participants O4, O6, 07, 08, A1, 02, and O1 indicate that the graduates struggle with the concept of customer service and take time to adjust to dealing directly with clients and that communication in both oral and written form is extremely important as is communication etiquette. Although they have a communication subject (A1), this does not provide the customer service element that they are faced with in the industry. Participant O12 indicated that it is very time-consuming having to train, mentor motivate and mentally prepare students who have no industry experience and sees this as a time-consuming exercise, therefore, prefers to employ people who have experience.

A1 indicated the students are "*not open to more advanced projects and lack entrepreneurship skills and knowledge on how to run their own businesses…. They do not see the potential of starting a business in the events industry. The students also lack the ability to problem solve, do not have the essential communication skills or critical skills, and often lack responsibility… this can be seen in time management, expecting lecturers to solve their problems. Students need to be more dedicated towards their studies and the institution should make provision for more practicals and the assessment policies should be revised*". In addition, the participant raised the fact that there should be more emphasis on personal skills and encouragement of practical application. As mentioned by the academics providing personal and social skills can be challenging in traditional universities as the focus is more on transmitting knowledge and theory. In addition, the event industry is an evolving and fast-paced industry, unfortunately changing curriculums takes time as these have to be implemented following procedures set in place. In addition, participant A3 indicated that many of the students admitted to event management, were not their first choice of study. "*There should be a more stringent recruitment process to ensure that the correct students are being recruited for the correct programmes and perhaps in some way aligned to the student's personality".* Participant O13 indicated that the students were not prepared for an office environment and did not understand how all the elements of an event and the process fit together.

A study conducted by Tran (2108) indicated that graduates in the United States lacked soft skills more than technical skills, specifically communication, managerial and supervisory, teamwork, problem-solving, leadership and project management skills. These skills are seen as essential skills in the event environment.

Closing the gap and overcoming the challenges (theme 3)

There was a general understanding between industry and academia that closer collaboration should take place between higher education and industry. Participant EA1 indicated that "*I would like to see closer collaboration with academia and working together on mentorship programs, guest lecturing, skills workshops"*. Participants O6 and O8 shared the same view. Participant 05 indicated that graduates need to be upskilled on personal attributes so that they can be 'work ready'. In addition, most of the participants indicated that mentorship, leadership and time management programs were essential in the events industry. There was consensus amongst the participants that the event industry is very diverse, and each area has its own set of skills and students should

be encouraged to work with the area that best suits their personal attributes where their strong skills can be recognised. Amongst the industry practitioners, there was a high regard for the Work Integrated Learning element which is a six-month compulsory module in the event management qualification. Some participants highlighted the value of this module, however, one participant mentioned that they felt it was time-consuming training the students and felt that they constantly needed supervision.

Participant 013 indicated that students should be encouraged to complete their WIL in more than one event environment so that they are exposed to all elements of an event. In addition, the participant indicated that Higher Education institutions should be more selective of their admissions as admit students who have a keen interest in events and also have the personal attributes that go with being an event manager. Many of the graduates are best suited for other industries and not events.

CONCLUSION

The participants and event management practitioners considered all of the above skills as important and relevant to the events industry. These results are consistent with many studies conducted around the world. These results confirm and document that there is a high regard for personal attributes in the event environment and therefore there should be strong collaboration and involvement between industry and higher education to participate in advisory forums, and curriculum development. However, it is noted that the challenge to traditional higher education training is that the focus is on knowledge skills and not practical skills. Industry however mentioned that the way to develop more effective personal and social skills is by adding more actual experiences into the curriculum, including field visits, guest speakers and workshops. In addition, assessments should strive to include more case studies and practical applications to the event industry. Various tasks could be emphasized to promote some of the personal attributes such as time management, and project management by ensuring students hand in tasks on time and if not, there are consequences. Objective assessments should be encouraged to promote social skills and the curriculum should be aligned to provide a strong, relevant and experience-based learning environment that is conducive to developing personal and social skills by applying the knowledge based on cognitive and analytical skills. The findings of this study will assist higher education to consider personal skills when re-curriculating.

CLIMATE CHANGE AND ITS IMPACT ON CALIFORNIA TOURISM -AI PROPOSALS AND PROPOSALS

Colin Johnson

San Francisco State University

Lam Family College of Business,

San Francisco, California, USA

Miriam Scaglione

HES Valais/Wallis

Institute of Tourism,

Sierre, Valais, Switzerland

ABSTRACT

California is one of the world's major economies, and tourism is one of the major drivers of economic output in the state, contributing $134 billion in travel spending, $11.9 billion in State and local taxes and is also California's leading export, (Visit California 2023). As with many other regions in the world, California has been affected by the impacts of climate change manifest through increasingly frequent and severe wildfires, oceanic rivers, mudslides, and droughts. The authors decided to test the efficacy of AI in determining the potential impact of climate change on the major tourism demand sectors of California tourism.

KEY WORDS: Climate change; California tourism; generative AI

1. INTRODUCTION

The famous author of the mid 20th century, Trumann Capote once wrote "California is the prelude to heaven".

Unfortunately, in the several decades since he wrote those beautiful words, Paradise was destroyed completely by the Camp wildfire in 2018 in California and so heaven has been somewhat disrupted by climate change.

For many years, tourism was seen as a largely benevolent foreign exchange earner, was actively sought and encouraged by governments, and an environmentally better alternative to extractive and industry development. In many countries, especially in small islands and developing nations, tourism is one of the most important sources of financial revenues, Dogru, Marchio, Bulut and Suess, (2019) WTTC (2021). The more disreputable side of the tourism equation, however, has been researched and publicized, especially in relation to tourism's contribution to environmental degradation and socio-cultural erosion, and the role that tourism plays in climate change (Hall, Scott & Gosling, 2013).

California is one of the world's major economies, ranking 5th in the world if it was considered a separate country.

Tourism is one of the major drivers of economic output in the state, contributing $134 billion in travel spending, $11.9 billion in State and local taxes, and employs in excess of 1.1 million jobs in 2022. Tourism is also California's leading export, with international visitors accounting for almost $1 of every $5 spent within California before the pandemic (Visit California 2023).

Recovery of international tourism has been slower than domestic tourism, however, and it is forecast that it will be another year for the revenues and visitor numbers to reach pre-pandemic levels.

It is the purpose of this paper to examine, through three AI applications the potential impact of climate change on the major tourism demand sectors of California tourism, comprising winter sports, outdoor recreation, theme park, urban, wine, festivals and beach and coastal tourism.

2. LITERATURE SEARCH

When deciding on a vacation destination, weather and climate are often significant considerations (Yanez, Hopkins & Porter, 2020). Climate is commonly defined as "average weather" or the long-term weather in a particular Climate may be defined as "average weather" or the weather one may expect to find in a specific destination over the long-term.

Up until the global pandemic in 2019, tourism had witnessed ten years of growth, with 1.47 billion international tourist arrivals. The pandemic, however, hit international tourism particularly hard, with the sector's contribution to GDP declining by 60% compared to an overall global decline of GDP of 3.7% (WTTC, 2021). Up until 2019. It appeared that there would be consecutive growth to the year 2030; Covid -19, however, dealt a very hard lesson to the tourism business, with major tourism organizations such as the WTTC renewing calls for the future tourism sector to be based upon a more inclusive, sustainable and robust model to cope with the existential threat that climate change poses (WTTC, 2021).

A 2008 study estimated travel and tourism associated greenhouse gas emissions (GHG's) to be 5% of global emissions in 2005. A study conducted in 2018 found that tourism's global carbon footprint was more than four times previously estimated, rising from 3.9 GtCo2e in 2009 to 4.5GtCO2e in 2013, and accounting for 8% of GGHE's (WTTC2021).

When comparing tourism to the entire economy as a whole, a recent study shows that tourism is more vulnerable to climate change than the entire economy and a country's resilience and vulnerability to climate change depend to a large extent on its economic development. Regions that were highlighted as being most at risk from climate change included small island nations, less developed countries and arid, dry countries in Africa, due to the strong

reliance on agriculture and tourism in their economies (Dogru et al, 2019). These are also the regions that suffer from a lack of research into climate change and the effects on their tourism industries (Scott and Gossling (2022)

Although as recently as 2014, the impact of climate change on tourism was subject to some level of uncertainty (Shani and Arad, 2014a, 2014b) the subsequent strong repudiations from Hall et al (2015a, 2015b) made clear the inherent danger of climate change to the tourism sector, both from the demand and supply side (Singh, Bhatta and Modi 2023). It has also been suggested that future changes in international and domestic tourism flows will change in parallel to the changes in destinations' climates due to climate change (Dogru et al, 2019).

There have been several studies implicating different sectors within tourism that may be most evidently affected by climate change, notably beach tourism (coastal erosion, loss of destinations, warming oceans, loss of marine life etc); Cabana, 2023) mountain tourism and ski resorts (reduced snow cover and shorter seasons, yet contradictory changes in summer) (Steiger et al, 2022) island economies (existential threat to the nation), wine tourism (change of seasonality from summer to spring) (Sottini, Barbierato, Benetti & Capecchi (2021). In addition, there will be changes in tourism flows, as destinations that are attractively warm now to those living in colder climates may become unattractively hot, and the home destinations may become warmer and more attractive, negating the need or wish to travel (Yanez, Hopkins & Porter, 2020).

Although the literature on climate change and tourism has expanded, especially in recent years, there are still many areas where knowledge is missing or not being used to good effect, especially in terms of using academic research for practical applications for the tourism industry or governmental policy makers (Loehr & Becken, 2021) Yanez, Hopkins & Porter, 2020 ; Scott and Gossling 2022).

Scott and Gossling (2022) in their review of the climate change literature related to tourism noted that there are two major strands of research: firstly, the body of work related to carbon risk and the estimations of greenhouse gas emissions and efforts to mitigate their effect and decarbonize the sector. The second strand is that of climate risk and its physical and socio-economic impacts.

Despite the increase in research and "there are many important knowledge gaps related to the consequences of an increasingly climate disrupted world for tourism" (p.8). Indeed, notwithstanding this increase in especially academic knowledge, it would seem that many tourism industry practitioners have continued with a "business as usual approach" continuing to grow destinations in exposed locations and investment continuing in carbon concentrated technologies (Loehr & Becken (2021). This view of industry unpreparedness is reinforced by Scott and Gossling (2022) who state that the "tourism sector is currently unprepared for the enormous knowledge requirements of the transition to climate resilient tourism development" (p.9).

Specifically Scott and Gosling (2022) noted that there are 5 knowledge gaps:

- Geographic knowledge gaps (especially related to the global south that is particularly vulnerable, including small islands and regional gaps- Asia, Africa, M. east and small islands);
- Strategic knowledge gap related to sector emission, decarbonization strategies and related issues to deep decarbonization pathways;
- Knowledge gaps in consequence of the increasingly disrupted world for tourism;
- Need for more research that captures the complexity of the climate change and tourism nexus with more knowledge of the place of tourism in climate resilient development (which still remains in an embryonic state);
- Need for more research at the interface between science and governmental policies; it is asserted that tourism and climate policy at national level is incoherent.

Loehr and Becken (2021) concur with the latter point, stating that due to differing objectives, desires and priorities these factors represent major obstacles to the transfer of knowledge from academia to industry practitioners.

Climate change, California and tourism

Since 1895, annual air temperatures in California have risen by approximately 2.5 degrees Fahrenheit (Indicators of climate change in California, 2022). As with many other regions in the world, California has been affected by the impacts of climate change. There has been a dramatic intensification in heat across the state, and it has been estimated that by the end of the 21st century, summers in California will be hotter than summers in Louisiana and Texas today, with a doubling or even tripling of extremely hot days (temperatures above 95 degrees F) (From Boom to Bust, 2015). Eight of the warmest years have occurred within the last decade, with record temperatures in 2014-2015. (Indicators of climate change in California, 2022). The wildfires in California have also been widely reported for their effect on the general population, tourists and general health. The area burned by wildfires has increased dramatically over the past twenty years. In 2020 alone more than double the area burned in any other year on record, at 4.2 million acres. The 2020 August Complex fire was the first "gigafire" burning in more than 7 counties and over 1 million acres (Indicators of climate change in California, 2022). It is obviously not just the fire but also the smoke that can have such a dangerous impact on health resulting in major park closures such as Yosemite National park, and tourists having to be evacuated, as has happened at major tourist attractions such as Lake Tahoe in August 2021.

At the other end of the scale, it is forecast that there will be between a 60-90% decline in the average number of days below freezing per year statewide. This will result in a change from snow to rainfall, that will have a major impact upon California's snowpack, that is considered a mainstay of providing freshwater supply for agriculture, industry and communities. This loss of snowpack will obviously impact upon winter recreation and tourism businesses. This will result in a significant decline in the length and quality of the ski season, along with increased operating costs for snowmaking equipment.

As California also generates a large share of tourism revenues from outdoor tourism, numbers of visitors may well be reduced due to higher temperatures and reduced availability of water, along with the increasing number and severity of wildfires. Popular inland summer destinations such as Yosemite National Park will lose their attractiveness in the peak summer months as higher temperatures will make many outdoor activities unappealing.

Beach and coastal tourism may be impacted by coastal erosion due to rises in sea water, flooding and damage to transportation infrastructure and facilities, along with negative impacts on marine life (Indicators of climate change in California, 2022). Wine tourism, that is also important in many counties throughout the state may also see similar trends to those in Europe, where researchers are predicating changes to visitation from summer to spring (Sottini, Barbierato, Benetti & Capecchi, 2021)

3. METHODOLOGY

Artificial Intelligence or machine learning has impacted many aspects of professional and personal life. Several studies conducted last year stated that AI enabled workers to both complete tasks more quickly and improved the quality of their work. A survey of 21 countries from the University of Toronto suggested that 63% of respondents are aware of ChatGPT. Of those aware, around half reported using ChatGPT at least once weekly. The highest countries with awareness were India (83% awareness) and Kenya (81%awareness). The US rating was 55% (AI index report, 2024)

The authors decided to test the efficacy of AI in determining the potential impact of climate change on the major tourism demand sectors of California tourism. For the purposes of seeing the influence of AI utilized three AI tools were utilized:

Table 1: Description of three AI tools

AI Application	**Description**
Google Bard	Available from March 2023, an AI tool that is designed to help researchers write scientific research papers more efficiently and effectively
ChatGPT 3.5	Available from March 15, 2022. Chat GPT3.5 made significant improvements on GPT-3. It is an Interactive AI capable of conversation, providing information, and generating text-based content.
ChatGPT4	Available from March 14 2023: GPT 4 is able to handle real-time information better and can provide more nuanced and relevant information than ChatGPT3.5

The three AI applications were asked to provide the following information:

Could you write a text of at least 1000 words about "How climate change will impact California Tourism?

The documents were then inputted to the statistical program Sphinx IQ3 (https://www.lesphinx-developpement.fr/logiciels/enquete-analyse-sphinx-iq/) for analysis tests. Word clouds were created, and a hierarchical classification of the text that consists of 4 clusters. None of the documents has the required length of 1,000 words: Bard Google's length was 699, ChatGPT 3.5 was 806, and ChatGPT 4 was 811 words.

An inspection of thef three documents shows the following that mountain region and winter tourism is treated by all the three documents while all the others in table 2 are present in only two.

Table 2: Subjects according to individual AI

Subjects	ChatGPT3.5	ChatGPT 4	Bard
Coastal changes	YES	YES	
Wildfire Risks and Air Quality	YES		YES
Water Drought	YES		YES
Mountain region - winter tourism- Sky resorts	YES	YES	YES
Urban aspect	YES	YES	
Economic & Societal implication -Policy resorts		YES	YES
Future aspects		YES	YES

The following aspects are only present in only one of the document: agriculture and wine tourism in ChatGPT4; The paradox of heat (summer activities and heat stress) along with Adaptation and Transformation (The path forward) only in Bard.

4. RESULTS & DISCUSSION

Sphinx IQ3 produced two different analyses, the first one having as its basis the whole text document and the second having as a statistical unit the sentences of each document.

Figure 4: Distribution of subjects across the three documents.

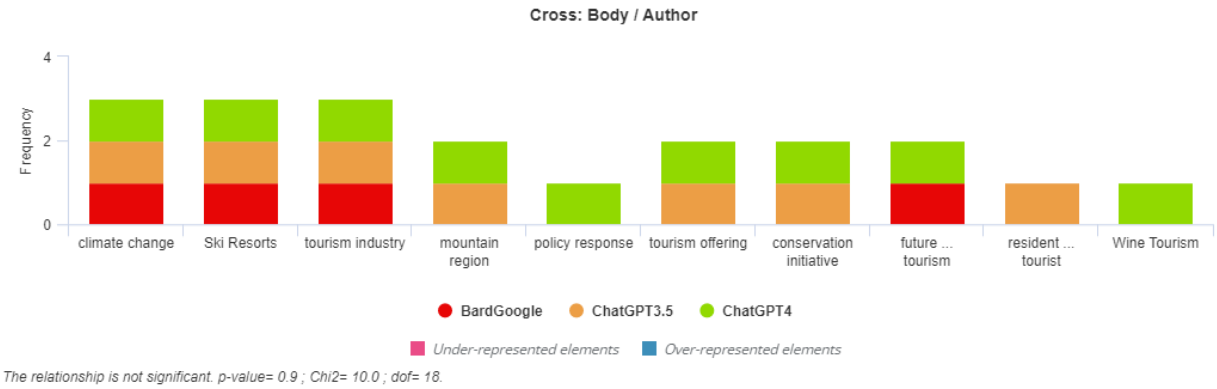

Figure 1 shows the analysis yield on the basis of the documents as statistical unit which is in line more or less with the analysis of the title of the section in the table above. Nevertheless, the $\chi 2$ test is not significant (p-value = 0.9) suggesting that from the point of view of the thematic structure there are not significant differences.

Figure 5: Words clouds for the three documents.

Figure 2 shows words clouds for each of the documents, the density of the graph is correlated to the number of words, so Bard is less dense. Central words are climate change and tourism in the three cases.

Figure 6 Correspondence analysis on the sentences as the statistical unit.

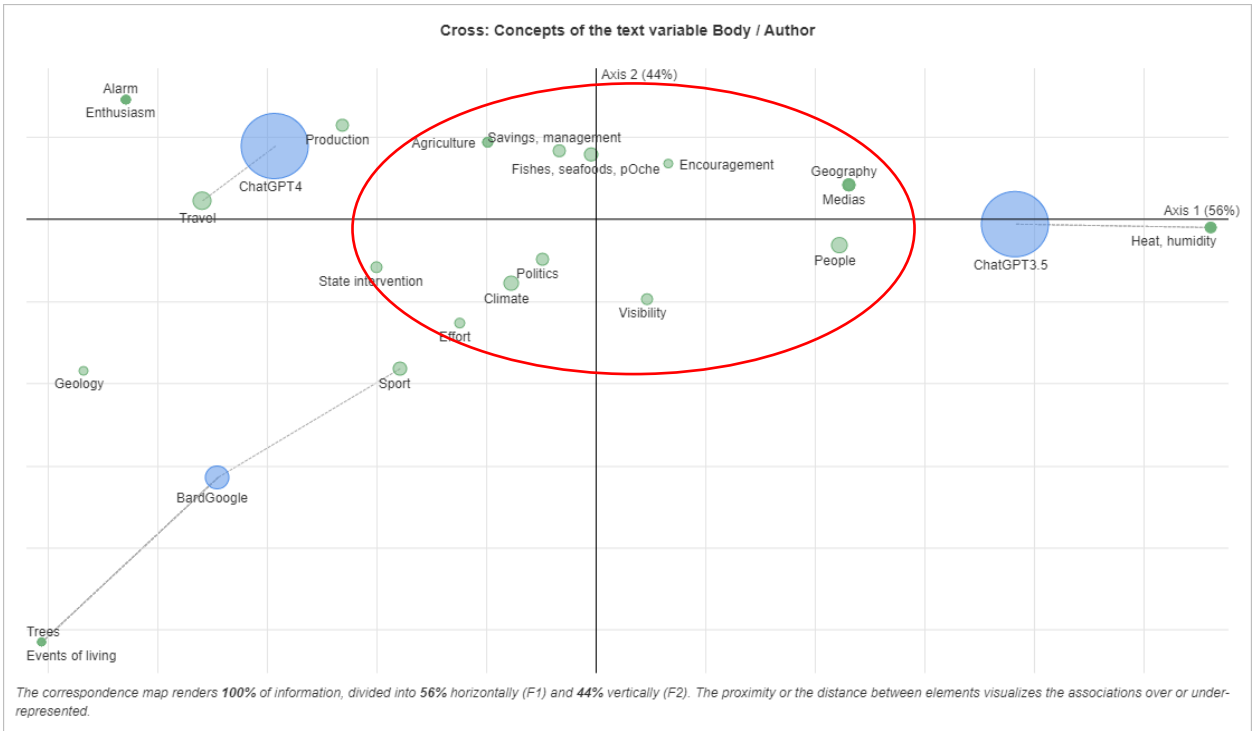

Figure 3 shows correspondence analysis on the sentences as the statistical unit and the categories built by SphinxIQ3 explain almost 100% of the variance. The red balloon in the center of the axis indicates the subjects common to the three documents, the size of the light blue balloons are proportional to the size of the three corpus

Figure 4: Clusters obtained using hierarchical classification by AI source.

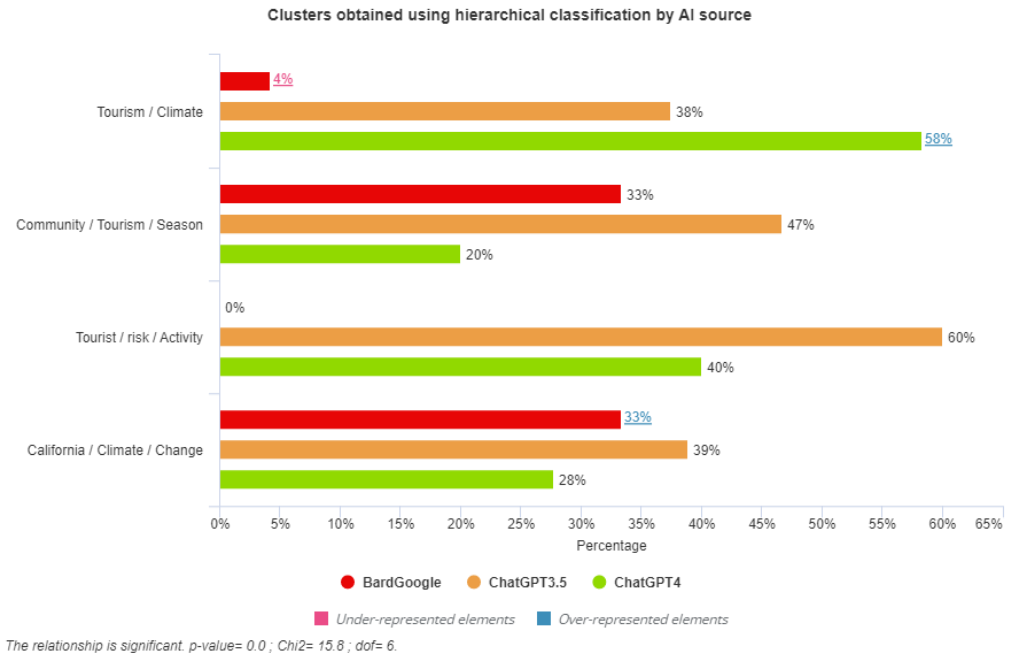

Figure 4 shows clusters obtained using Alceste method (Younès Boughzala & Moscarola, 2013; Younès Boughzala, Moscarola, & Hervé, 2014) embedded in SphinxIQ3. This analysis yield four different sematic categories and the test $\chi 2$ is significant showing the relevance of the results. It is of note that the following are over represented by the different AI's:

- ChatGPT4 has overrepresented the general aspects "Tourism /Climate":("however, climate change-induced sea-level rise, increased frequency of extreme weather events, and ocean acidification pose grave threats to these coastal areas")
- ChatGPT3.5 insists more than the others in societal aspect of climate change "Community/Tourism/Season" ("embracing the principles of stewardship and conservation can ensure that future generations continue to enjoy the natural beauty and cultural richness of the Golden State"); and also the risk aspect: "Tourism/risk/Activity" ("poor air quality due to wildfire smoke poses health risks for residents and tourists alike, deterring outdoor activities and diminishing the appeal of popular destinations such as Yosemite National Park and the Sierra Nevada mountains").
- Bard has over-represented aspect specifically in California "California/Climate/Change": ("from world-class beaches and redwood forests to bustling cities and iconic landmarks, California offers a diverse range of experiences").

5. CONCLUSIONS

Climate change is a fact of life for most of the world's population. Climate change affects both the tourist demand and supply. Much of the literature has focused upon adaptation and mitigation strategies for those destinations affected by climate change. A rather far thinking and drastic example would be the island nation of Kiribati that negotiated with Fiji to purchase 22 sq. km of land to move their population of 60,000-70,000 to escape from the extreme effects of climate change (Dogru et al, 2019).

Possible mitigation strategies could include the monitoring and assessment of current and future effects of climate change on tourism operations, and the implementation of adaptation measures that reduce greenhouse gas emissions and implement low-carbon tourism policies and practices.

It could be seen from the AI responses that they tended to be superficial and lacked nuances. All of the models lacked some of the major themes associated with climate change and tourism in California, and the AI's did not identify some of the major authors associated with climate change and tourism. What was impressive, however, was the speed at which the reports could be generated and the interactivity with the AI.

6. LIMITATIONS OF RESEARCH & FURTHER STUDY

This was an exploratory study and conducted over a short period of time with very little resources. It would be very interesting to revisit the theme in future months as the funding in AI almost octupled from 2022-2023, with $25.2 billion invested in generative AI (AI index report, 2024). With the improved performance, AI may be used to address some of the important knowledge gaps identified in the literature serach. It will be fascinating to see the power and reach of the next generation of AI's within the next year.

COMMERCIAL ACTIVITY IN OUTER-SPACE THROUGH SPACE TOURISM FLIGHTS: WHEN WILL THE SPACE ADVENTURE END?

Ms Krishnee Adnarain Appadoo
Senior Lecturer, University of Mauritius, ka.appadoo.uom.ac.mu, PhD Candidate University of Western Australia

Professor (Dr) Rajendra Parsad Gunputh
University of Mauritius, rpgunput@uom.ac.mu

Mr Joseph Assogbavi, MPhil/PhD Candidate
University of Mauritius, kossi.assogbavi@umail.uom.ac.mu
Corresponding author: Ms Krishnee Appadoo; Email: ka.appadoo@uom.ac.mu

Abstract.

Based on some research which has carried been out on space tourism, this empirical paper explains to what extent space tourism would be a new source of commercial activity with low costs for paying customers to suborbital and orbital flights. With secondary data this paper sets out intricating legal issues (space accident, GHGs or pollution in all its forms under public international law to preserve the space, the atmosphere and the environment) coupled with companies (Blue Origin, Space X or Virgin Galactic) and their monopoly to have an upper hand on commercial space tourism for billionaires to experience weightlessness in outer space, space marriage without overlooking the splendid panoramic view of the blue planet but still there is a price to pay. It has been found that most companies and their commercial activity are also the same founders behind these companies allowing only private passengers who went in the outer space by special spaceship. Actually, more than 800 tickets have been sold with a significant cost of $450 000 *per* seat for billionaires explaining that there is room for space tourism and much more can be done so that the price per seat is available but at a relatively low cost as the quest for space tourism is still promising. With the advancement of technology and the involvement of more and more space companies to provide space tourism, in addition to scientific research, as one of their services at a lower cost is a pertinent issue but a feasible one. Marketing of space tourism, reducing the ticket prices, media coverage or sponsorship would probably pave the way for more accessible space tourism as a form of commercial activity in the space reducing price discrimination. The research methodology will also include primary data collected with a number of participants (n=150) which are implemented by using SPSS and other available devices to mount the facts and findings with relevant questions on the subject matter using Likert Scale. The paper will close with some recommendations and a list of references to enhance further development in this sphere of law and space and marketing. What shall come out of this study would indicate whether there are prospects for creating jobs in this emerging sector, the potential stream of revenues that it may generate or not, the intervention of the media to cover space flights through TV, radio or newspaper documentaries, reports or research capable of generating licence fees, marketing or drive economic growth to bring people together inspiring them to achieve their dream. However, with nations battling against, *inter alia*, environmental change, climate change, GHGs emissions, pollution and pollutants in the atmosphere space tourism, as a new form of space adventure, may create some additional fear especially among, *inter alia*, governments, NGOs and other environmental fighters and, consequently, it may come to an abrupt stop even before it has started burgeoning.

COMMUNITY BASED URBAN HOSPITALITY: CREATIVITY, INNOVATION AND TOURIST EXPERIENCE

Prof. Alon Gelbman PhD

Department of Tourism and Hotel Management
Kinneret Academic College, Israel
alongelbman@gmail.com

Abstract

This research links urban hospitality, tourist experience, and the management of innovation and creativity in tourism. Growing specialization and competition create new challenges for urban tourism. Simultaneously, tourism and the tourist experience are becoming central elements in the establishment of a socially significant sustainable tourism product based on the local community. The focus of this study is an urban hospitality organization whose vision and set of values are the basis for a management strategy striving to create and offer a unique tourism experience.

Creativity and innovation in tourism and hospitality management have become complex tasks due to the competitive tourism destination market in general and urban tourism destinations in particular. Hospitality organizations aspire to meet growing tourist expectations for a specialized experience by emphasizing the characteristics of the local culture and urban community. The purpose of this paper is to examine how the management of an urban hospitality organization implements community-based and social values in each of its hostels, and how they adapt the tourist experience to the culture and atmosphere in each city (Nazareth, Jerusalem, and Tel Aviv). The theoretical framework is based on the important relationship linking urban hospitality, the tourist experience, and the management of innovation and creativity in tourism, in an era of competition and specialization, while urban tourism theory faces new challenges.

The methodology includes qualitative research methods and three forms of data collection: participant observation, document review, and in-depth interviews. The findings of this study are adding a new dimension to the existing knowledge, namely the role of creativity and innovation in helping the management of an urban hospitality organization to shape the tourist experience. This study presents a new and unique model for implementing creativity and innovation in urban hospitality management. The model aims to reflect the influence of a hospitality organization's creative and innovative efforts to enhance the tourist experience. It describes the connections and the interactions between three aspects – local community-based aspects, social aspects, and local and regional tour aspects – arising from the management's vision and values in respect to the tourism product. The global significance of the paper is in proposing a model that may be of use as an effective measure for other hospitality organizations seeking to adopt their own vision and values in the tourism product and tourist experience.

THEORETICAL ANALYSIS OF CONSUMER BEHAVIOR IN THE TOURISM AND HOSPITALITY SECTOR: AN ASSESSMENT OF OPPORTUNITIES AND CHALLENGES IN PROMOTING ENVIRONMENTALLY FRIENDLY PRACTICES FOR THE PROMOTION OF SUSTAINABLE TOURISM.

Toshima Makoondlall-Chadee

Maître de conférences, École de développement durable et de tourisme, Université de technologie, Maurice,

tmchadee@utm.ac.mu

Naria Olivier

Maître de conférences, Département STAPS, Université de la Réunion,

olivier.naria@univ-reunion.fr

Bokhoree Chandradeo Sanjeev

Professeur, École de développement durable et de tourisme, Université de technologie

sbokhoree@utm.ac.mu

This research work examines the complex relationship between consumer behaviour and the tourist and hospitality industries, focusing on the theoretical frameworks that influence decision-making processes. By analysing well-known theories such as the Theory of Planned Behavior (Ajzen, 1991), Social Identity Theory (Tajfel & Turner, 1979), Maslow's Hierarchy of Needs (Maslow, 1943), and various consumer decision-making models (Engel, Blackwell, & Miniard, 1990), by exploring how these theories might be used to comprehend and forecast consumer behaviour specifically in the tourism and hospitality industry.

Theoretical exploration establishes the foundation for a thorough analysis of the opportunities and problems involved in achieving sustainability within various businesses, with an emphasis on promoting environmentally responsible behaviours. Businesses can enhance customer pleasure and loyalty by tailoring sustainable experiences to individual preferences within the domain of personalisation and customisation (Kim, Kim, & Han, 2017). Nevertheless, successfully implementing such customised strategies necessitates a comprehensive comprehension of customer anticipations and inclinations, specifically for eco-friendly selections.

For instance, the significance of digital marketing and social media in shaping customer behaviour in the tourist and hospitality industry is vital in the era of digitalization. Utilising Internet channels to promote sustainable choices is crucial. However, businesses encounter the obstacle of tackling greenwashing and guaranteeing that their endeavours correspond to sustainable standards (Choi & Agrawal, 2019). The work explores the possibilities and difficulties presented by the digital environment, emphasising the importance for businesses to effectively communicate and promote environmentally friendly projects.

Changes in population characteristics substantially influence people's tastes and expectations, which can be advantageous or problematic when trying to encourage environmentally friendly actions. It is crucial to modify

services and marketing methods to meet the needs of various sustainable demographics. For organisations in the tourist and hospitality sector, it is essential to comprehend the motivations and values of various age groups to cater to environmentally conscious consumer preferences (Swarbrooke et al. 2003).

This study utilises a systematic method, combining a thorough examination of existing literature with practical case studies and input from industry experts and customers. This comprehensive approach offers a complete overview of the present state of sustainable tourism, providing practical insights for firms seeking to match their practices with changing consumer expectations and promoting environmentally beneficial behaviours.

The discussion highlights the importance for organizations in the tourism and hospitality sector to comprehend customer behaviour to encourage and establish environmentally friendly practices, based on the synthesis of theoretical frameworks, possibilities, and obstacles. Businesses are advised to acknowledge the crucial significance of customer behaviour in promoting sustainability and are given practical suggestions for integrating pro-environmental efforts into their strategy, to improve their competitiveness within these rapidly changing industries.

This study emphasises the crucial importance of comprehending customer behaviour in influencing the direction of the tourist and hospitality industries, specifically in promoting environmentally friendly methods to attain sustainability (Serra Cantallops & Salvi, 2014). The study enhances the ongoing discussion on achieving sustainable tourism by combining theoretical frameworks and empirical research. It provides a detailed understanding of consumer behaviour in the tourism and hospitality industry.

THE INFLUENCE OF COLLECTIVIST AND POWER DISTANCE CULTURES ON EMPLOYEES' ORGANISATIONAL COMMITMENT: THE CASE OF SMALL HOSPITALITY ENTERPRISES IN GHANA.

Micheal Evans

University of Salford

Abstract

Organisational commitment literature is extant particularly in the developed countries in the West, however, influence of collectivist and power distance cultures culture dimensions on employees' organisational commitment in the context of Sub-Saharan countries such as Ghana has not been well studied. Recent studies have emphasised the necessity for academics to investigate how collectivist and power distance cultures affect employees' organisational commitment in the workplace, such as how to develop connections with work colleagues and leaders.

Moreover, proposals for undertaking empirical research in emerging countries with growing populations have been made, such as sub-Saharan Africa, a place with various cultural characteristics from the developed countries that may affect employees in the small hospitality sector. This study attempts to address the research gap on the importance of collectivist and power distance attributes on employee's workplace behaviour leading to their organisational commitment.

The primary aim of this study was to examine attentively the significant influence that collectivist and power distance cultures play in how employees interact in small hospitality firms. The study also looks at the situation of small hospitality businesses run by indigenous Ghanaians. Four small hotels in the Greater Accra Metropolitan area in Ghana with similar potentials were utilized in a multi-case research utilising qualitative methodology.

Four employees from each hotel were the subject of in-depth interviews, resulting in a total of sixteen participants for the data collection. The results were thematically analysed following the implementation of a cross-case and within-case strategy determined by topic analysis.

Empirical evidence suggests that the Ghanaian collectivist and power distance cultural values had the greatest influence on employees' organisational commitment.

Keywords: collectivist, power distance, hospitality, organisational commitment, employees

TOWARDS TRANSFORMATIVE EVENT EXPERIENCES: SOCIAL AND ECONOMIC PERSPECTIVE

Krzysztof Celuch

Department of Organizational Behavior and Marketing, Faculty of Economic Sciences and Management, Nicolaus Copernicus University in Torun, Poland 2.

Vistula School of Hospitality in Warsaw, Poland

Abstract

With the advent of the transformation economy, experiences in tourism, hospitality and events are changing (Neuhofer et al., 2020; Teoh et al., 2021). The events industry is shifting from offering conventional conferences and meetings that are positive, engaging and memorable to the next level of experiences that are potentially life-changing. The rise of transformative event experiences (TEE) can be observed all around the globe. These range in purpose and scale - from small mindfulness retreats to intentional leadership circles, extraordinary educational experiences to large electronic-dance music festivals. In this context, event organisers are at the forefront of leaders who pioneer a new generation of event experiences with a transformational impact. While there is extensive literature recognise the transformative nature of tourism and travel, dating back to Kottler (1998) and more recent work (e.g. Kirillova et al., 2017; Sheldon, 2020), the nature of transformative events are less known. Building on previous literature, this study thus aims to explore the future of transformative event experiences form a transformational leader's perspective. Through a theoretical lens of experience design (Neuhofer et al., 2020) and transformational leadership (Bass, 1985), an interview instrument was developed to enquire leaders about transformative events in Poland. Questions include personally transformative experiences, long-term impact with cognitive and behavioural change, organisational vision of TE, role of leaders, organisers and on-site team in guiding TE, mindset, skillset, motivation and training of staff, and key developments in the next years. A qualitative semi-structured interview approach is adopted. Through a purposive sampling approach, data is collected at Polish leading meetings industry events (e.g. Meetings Week Poland, Events Industry Forum 2023). The preliminary analysis following a first cycle of data collection, indicates several key themes highlighting the role of events as catalysts of change. New formats are emerging, which re-define events from classic conferences to collective experiences that impress with large-scale shows and spectacles or offer expensive formats with an intimate number of curated attendees to trigger personal change. Furthermore, transformative events of the future indicate to play a role in bringing important societal topics of change to the forefront, e.g. women empowerment, diversity, equality, inclusion, regeneration

AN AMENDED RESIDENTS' EMPOWERMENT THROUGH TOURISM SCALE: HOW IT STACKS UP ACROSS VARIOUS DEMOGRAPHICS

Background

Though the Galapagos Islands and the Amazon take center stage for ecotourism in Ecuador, another area of the country situated within the Andes Mountains is growing in popularity due to its more than 20 peaks of at least 14,000 feet in elevation above sea level or ASL (4,200 meters). As NOAA reports, Chimborazo, the highest peak in the region (20,702 feet ASL (6,310 meters), measures as the furthest point from the center of the Earth. In efforts to rebound from the COVID-19 pandemic, Ecuador's Ministry of Tourism (in January 2022) developed a new strategy to attract ecotourists—with the region including Chimborazo playing a central role to reach 2 million visitors by 2025 (González Lara, 2022). Due to ecotourism's novelty in the region, little is known about how empowered residents may be through this niche form of tourism. Therefore, using a modified Residents' Empowerment through Tourism Scale (RETS), this research aims to: 1) confirm the factor structure of the new RETS and 2) examine how six forms of empowerment may differ across distinct demographic variables among residents living adjacent to Chimborazo.

Methods

This study was undertaken in the high-altitude canton of Riobamba, Ecuador. Residents of the canton live among several volcanoes, notably Chimborazo, and parts of the canton are in protected natural areas such as the Chimborazo Natural Reserve and the Sangay National Park (Vizuete et al., 2021; Vizuete et al., 2022). Survey data were collected between May and August of 2022 through questionnaires administered at residents' homes by a member of the research team. Seven hundred homes were visited, 100 of which declined to participate. In total, 550 questionnaires were completed. Nine hundred fifty-six individuals submitted a questionnaire. We removed 54 questionnaires that were incomplete. The final sample size was 496 residents (368 urban, 128 rural).

Residents' empowerment through tourism (or RETS) was measured using 13 items across six distinct dimensions—economic (two items); psychological (two); sociological (two); cultural (two); political (two); and environmental (three)—based on Scheyvens and van der Watt's (2021) work. Six variables (i.e., age, gender, education level, residence location; length of residence; and tourism employment. Data were analyzed following confirmatory factor analysis (CFA) and multivariate analysis of variance (MANOVA).

Findings/implications

Prior to examining differences in RETS dimensions across demographic variables, the 13 items were subjected to a CFA. This resulted in a model fit of $\chi^2(n = 496) = 49.20$, $df = 50$, $\chi^2/df = 0.10$, CFI = 0.99, TLI = 0.97, TLI = 0.97, RMSEA = 0.01, and SRMR = 0.03. From the CFA, all 13 had standardized factor loadings greater than 0.70. Composite reliabilities for factors were in excess of 0.80. Further, the average variance extracted (AVE) for each dimension was greater than 0.60. These three estimates demonstrated convergent validity.

For age (Wilks's $\Lambda = 0.925$, $F(12,984) = 3.24$, $p < 0.001$), significant differences were found among five of the dimensions (except for psychological empowement) whereby younger residents (i.e., aged 18-29) reported higher means in empowerment than those at least 40 years of age. The MANOVA for gender (Wilks's $\Lambda = 0.992$, $F(6,493) = 0.66$, $p = 0.68$) was not significant. Like age, the MANOVA for education level (Wilks's $\Lambda = 0.738$, $F(24,1711) = 6.49$, $p < 0.001$) was significant, resulting in differences across all but psychological empowerment. Differences were most pronounced across residence locations (Wilks's $\Lambda = 0.303$, $F(6,493 = 188.65)$, $p < 0.001$) in that those from urban areas indicated a higher degree of empowerment from tourism than did those from rural areas. For length of residency (Wilks's $\Lambda = 0.928$, $F(12,984) = 3.13$, $p < 0.001$), differences were found in four dimensions (sociological, cultural, political, and environmental) where those who lived in the area for the least amount of time felt the most empowered by tourism. Finally, the MANOVA for tourism employment (Wilks's $\Lambda = 0.990$, $F(6,493) = 0.852$, $p = 0.531$) was not significant.

To advance a particular measure, exploratory research should be undertaken incorporating demographic variables. This helps lay the groundwork to better determine external validity of the measure's use in various contexts. The most pronounced differences demonstrated from the MANOVAs were seen in the analyses involving residence locations, age, and education level. Ecuadorians living adjacent to Chimborazo who are younger, with higher educations, and live in urban areas were those who reported feeling the highest level of empowerment through ecotourism. Managerial implications for such findings include governmental entities working to tap into ecotourism potential among those with highest degrees of empowerment. Future research opportunities will be discussed.

ENHANCING INCLUSIVE HOSPITALITY: AN INVESTIGATION INTO AUTISM-CERTIFIED HOTELS AND GUEST EXPERIENCES

Muhammet Kesgin

Rochester Institute of Technology

Jerrie Hsieh

Rochester Institute of Technology

Introduction

Vacationing is a common activity among American families, with childhood memories often involving an average of four annual vacations per individual (Melore, 2022). However, families with autistic children encounter unique challenges when undertaking travel. A survey by Autism Travel showed that 87% of the surveyed parents abstained from family vacations, 97% expressed dissatisfaction with current travel options, and 93% indicated that they would like to travel if autism-certified alternatives were available (IBCCES, 2020). Planning vacations is a complex task in itself, and it becomes even more intricate when accommodating autistic children. Thorough preparation involves responding to schedule changes, managing diverse stimuli levels, addressing anxiety, navigating dietary challenges, and adapting to unfamiliar environments. (Sedgley et al., 2017). Environmental factors, including lighting, noise, colors, and crowdedness, compound these challenges, often leading to meltdowns in autistic children and disrupting the overall vacation experience for the entire family (CDC, 2022; Kohl & Barnett, 2020). Globally, approximately 75 million people have been diagnosed with autism (World Health Organization, 2023). According to the CDC (2023), the prevalence of autism among 8-year-old children has increased from one in 44 in 2018 to one in 36 in 2020 in the US. With the rapid increase in the number of autistic children, there is an urgent need to evaluate the readiness of hotels catering to families with autistic children.

Purpose of the Study

This study aims to investigate the practices of autism-certified hotels in creating an environment conducive to enjoyable vacation experiences for families with autistic children. Additionally, it will explore the experiences of autistic families with these hotels.

Methods

Content analysis will be employed to examine the websites of 30 hotels awarded the Certified Autism Center (CAC) designation by the International Board of Credentialing and Continuing Education Standards (IBCCES). This analysis identifies and assesses the autism-friendly practices adopted by these hotels. Furthermore, content analysis is applied to evaluate customer reviews on TripAdvisor for these 30 certified hotels. Utilizing keywords such as "Autism," "Autistic," and "ASD," relevant comments are extracted, and major themes are systematically coded and categorized.

Significance of the Study

The research findings will benchmark best practices within autism-certified hotels, offering a valuable reference for non-certified hotels seeking to enhance services for autistic guests. Insights gleaned from guest reviews not only provide an evaluative lens for certified hotels but also offer a comprehensive understanding of the experiences of other guests interacting with individuals on the autism spectrum. Ultimately, this study will improve services for an often-overlooked demographic, allowing hotel operators to elevate the quality of accommodation for this underserved group.

BIGGER CROWDS, WORSE EXPERIENCE? AN EXPLORATORY COMPARISON OF TOURIST SATISFACTION IN THE COMPETITIVE ENVIRONMENT: THE EFFECTS OF TOURISM DEMAND SEASONALITY IN THE MEDITERRANEAN DESTINATIONS

Damir Krešić
Institute for Tourism, Zagreb, Croatia

Vjekoslav Bratić
Institute for Public Finance, Zagreb, Croatia

Josip Mikulić
Faculty of Economics and Business, University of Zagreb, Croatia
Institute for Tourism, Zagreb, Croatia

Abstract

This study aims to analyze whether there are significant differences in sources and levels of tourist satisfaction during the main season versus the off-season in a Mediterranean tourism country with a dominant sun-and-sea product, i.e., Croatia. This study is exploratory in nature but uses data collected as part of the TOMAS 2021 Croatia survey, a large-sample, country-wide and whole-year visitor survey conducted by the Croatian Institute for Tourism – Zagreb for the Ministry of Tourism and Sports. The exploratory analysis focuses on the following research questions: (i) Are there any significant differences regarding satisfaction during and off the main tourist season?; (ii) Do large numbers of tourists and the resulting crowdedness during the main season negatively impact tourist experiences and reflect in satisfaction ratings?; (iii) Which elements of destination supply satisfaction are most affected bi seasonality of demand? Elementary statistical procedures are used to analyze the data, i.e., descriptives, significance tests, and correlation analysis.

Keywords: tourist satisfaction; summer tourism; 3S; main season; pre-season; post-season; Croatia.

SOUVENIRS AND SENSE OF PLACE: SUPPLIERS' AND CONSUMERS' PERSPECTIVES

Dallen J Timothy

Arizona State University

Linsi He

Yuman University

Souvenirs of all types are among the most common elements of tourists' journeys. This paper examines the concepts of authenticity and sense of place in souvenir production and consumption with special focus on 'cultural and creative products' (CC products), which are becoming particularly popular in China and a few other East Asian countries. CC products are a unique hybrid type of souvenir that is mass produced but which is also designed specifically to highlight elements of local culture, especially in museum shops; many CC souvenirs depict works of art and artifacts from the museums where they are sold. We explore suppliers' and consumers' (tourists') perceptions of the role of place in souvenir making and souvenir buying, with the added dimension of authenticity. Results show that most producers stress the importance of place when designing CC souvenirs, and micro-innovations and homogenization emerged as new themes, wherein micro-innovations can help reduce souvenir homogenization. From the tourists' perspective, most tourists realize the importance of place representation in souvenirs, which creates a symbolic value in their souvenir purchase decision-making, but they are also influenced by other factors, such as functionality, price, aesthetics, and product quality. Unlike generic mass-produced souvenirs that rarely depict true elements of place, CC products have emerged to satisfy the needs of tourists for inexpensive mementos but also represent the place values of the destination.

CUSTOMER EXPERIENCES USING CLOUD KITCHENS WITH OMNICHANNEL INTEGRATION: A BEHAVIORAL REASONING PERSPECTIVE

Sameer Hosany

Royal Holloway, University of London

Mustafeed Zaman

EM Normandie Business School

Technological advancements have brought significant transformations in food production and delivery services. The emergence of cloud kitchens has drastically changed the food business industry. Cloud kitchens, also known as virtual kitchens, ghost kitchens, or dark kitchens, are commercial cooking space with no in-person dining facilities providing takeaway services via online platforms or telephone. Cloud kitchens operate in strategic locations to enhance cost effectiveness (i.e., low-rent areas to reduce cost or close to significant demand points to optimise delivery cost and time). This study draws on Behavioral Reasoning Theory (BRT) to investigate customer experiences using cloud kitchens. BRT determines the linkage between beliefs, reasons, motives, intentions, and behavior. The reasons for and reasons against constructs represent important aspects of BRT in explaining behaviors. To date, applications of BRT is relatively new in the marketing literature. Drawing on BRT, we develop a model to examine the effects of reasons for and reasons against using cloud kitchens omnichannel service. Measures for all constructs (omnichannel integration, reasons for and against using cloud kitchens, attitudes, subjective norms, perceived behavioural control and behavioral intentions) were adapted from previous studies. Data was collected using a purposive sample of 411 customers who have ordered food from delivery apps, online platforms, or virtual kitchens. Partial least squares structural equation modeling (PLS-SEM) was used to test the hypothesised relationships. Findings indicate that omnichannel integration shape customers reasons for and against using cloud kitchens which subsequently influence attitudes, subjective norms and perceived behavioural control. Attitudes and subjective norms predominantly drive initial purchase decisions, while perceived control over dining choices underpin longer-term loyalty. This research advances the emerging literature on cloud kitchens in relation to omnichannel integration. Findings emphasise the importance of implementing omnichannel strategies for cloud kitchens to effectively address the changing demands of customers.

EXPLORATION OF INDIGENOUS KNOWLEDGE SYSTEMS AND RESPONSIBLE FOOD CONSUMPTION AMONG LOCAL CONSUMERS

Erisher Woyo
Manchester Metropolitan University
Manchester, United Kingdom

ABSTRACT

The study investigates the intersection between indigenous knowledge systems and responsible food consumption within the framework of advancing sustainable tourism goals delineated in Agenda 2030. Tourism and hospitality, functioning as an economic pursuit, encompasses various environmental repercussions (Miralles et al., 2023). The agenda 2030's Goal 12 underscores the imperative for fostering sustainable consumption and production patterns, which is notably significant for the tourism sector (Dolnicar, 2023). Specifically relevant to hospitality businesses are the specified targets aimed at sustainable use of natural resources, reduction of food waste, waste generation mitigation, and monitoring environmental aspects of tourism (Dolnicar, 2023). While there is a significant amount of research on food waste, food consumption and attitude-behaviour gaps (Long et al., 2023) limited research exists on understanding how indigenous knowledge systems contribute to shaping sustainable food practices and its importance on achieving the goals set forth by Agenda 2030. Despite the increasing emphasis on responsible consumption and behaviours, there exists a recognised attitude-behaviour gap, wherein well-intentioned initiatives do not consistently translate into sustainable practices (Longo et al., 2019), suggesting the need for further exploration and interventions targeted at modifying behaviours associate with food waste. The research methodology employed in this study involved in-depth interviews, non-participant observation and photo food diaries, conducted specifically within urban traditional restaurants in Zimbabwe. These methods were employed to explore and understand the practices embedded within indigenous knowledge systems of local customers. Findings offer critical insights into the multifaceted role of indigenous knowledge systems play in shaping sustainable food consumption. Results demonstrate the significance of traditional food meanings, the incorporation of such foods in consumption practices, and strategies for managing food waste within these traditional dining contexts. These findings contribute theoretically by enriching our understanding of how indigenous knowledge systems inform and influence sustainable food practices among consumers in the hospitality sector. Moreover, the practical implications of this study are substantial, as it provides guidance towards building and fostering sustainable food systems. By acknowledging and leveraging the knowledge systems, this study highlights the potential to create healthier and more sustainable food practices, aligning with broader agenda of achieving sustainability goals for a healthier planet.

CONCEPTUALIZATION OF THE FRAMEWORK FOR INNOVATIVE SMOKING CESSATION SERVICES IN HOSPITALITY AMBIANCE

Marie CHAN SUN

University of Mauritius

The Smoke-Free Support (SFS) Hotel Concept is a radical form of innovation as it brings along smoking cessation services in hotel settings, specifically the wellness area of the hotel. Indeed, this concept aspires to delocalize smoking cessation services delivery from hospital setting to hospitality ambiance. It has three components: (1) comprehensive smoke-free environment in the hotel indoor and outdoor premises for healthy hotel stay and work place, (2) stop smoking service by experts in the field for smoking cessation by smokers who want to quit, and (3) health culture sensitization among hotel clients and staff for the promotion of public health.

Objectives:

The aim of this research work is to put forward the framework for developing the SFS Hotel Concept. Its objectives are as follows:

(1) to conceptualize the logical structure of the measures to be undertaken for the implementation of this new marketing strategy, and

(2) to illustrate the required considerations for branding the SFS Hotel Concept

Methods:

A qualitative study, based on grounded theory approach, was undertaken to explore stakeholders' views on the SFS Hotel Concept and to gather information regarding its feasibility, implementation, time frame, resource persons and anticipated obstacles. Institutional ethical clearance was obtained prior to the start of the study. Purposeful sampling was used to recruit stakeholders in the tourism industry, from both the private and public sector and also from interest groups. Data collection, through in-depth interviews, and data analysis, through open/axial/selective coding, was undertaken as an ongoing simultaneous process until theoretical saturation was reached.

Findings:

Data generated by this grounded theory study led to the formulation of a framework for implementation of the concept. There are three basic requirements for the concept to get started: deciding to adopt the concept, having funds available for training, communication and marketing strategy and being able to federate stakeholders for continued collaboration. The collaboration of all stakeholders is a mandatory element for successful implementation of the SFS Hotel concept. This project needs the involvement of both internal and external stakeholders.

Discussion:

The conceptualized framework lends support to the feasibility of the implementation of the SFS Hotel Concept. With the rise of health tourism in the world and in the context of smoke-free laws worldwide, this new concept constitutes a new marketing strategy to promote health tourism. The SFS Hotel Concept, designed on the basis of the World Health Organization Framework Convention on Tobacco Control, is in line with the United Nations Sustainable Development Goals, because its implementation will entail better global health, by the decrease of the number of smokers in the world, and cleaner environment by the decrease of the number of cigarette butts discarded in the environment. To conclude, the prevalence of smokers in the world is an untapped market to be considered by the tourism and hospitality industry. This untapped market is creating the opportunity for cities, countries or Small Island Developing States to position them as health tourism destinations for smoking cessation in a supportive environment.

Keywords: Framework, Smoking cessation, Public health, Health tourism, Marketing strategy, Mauritius.

INFORMATION TRANSMISSION BETWEEN FOOD & BEVERAGE AND LODGING STOCKS

Mario G Reyes

Washington State University

ABSTRACT

In this paper, we examine the temporal dynamic of two key sectors in the U.S. hospitality industry. Whereas voluminous studies have examined cross-market linkages, there is paucity of research on the intertemporal relationships across sectors in the hospitality industry. In the US, Lin et al. [2022] investigate the sector stock performance of airlines, gambling stocks, hotels, leisure services, restaurants and bars, and travel and tourism during the COVID-19 pandemic. Maroble and Kansheba [2022] examine volatility spillovers in tourism and travel, hotel and lodging, recreational services, and food and beverages.

We seek to contribute to this extant strand of research by documenting the information transmission between Food and Beverage (F&B) and Lodging stocks. Research has shown that F&B stocks tend to behave differently than Lodging stocks. For example, Lin et al. [2022] show that co-movements with the market index and idiosyncratic risks differ markedly across subsectors in the hospitality and tourism industry. For example, they find that the period of high volatility in the restaurant, gaming, and hotel industries is relatively short compared to the other sub-sectors. Hsu and Jang [2008] present some evidence showing that financial variables have different effects on the unsystematic risk of lodging vis-à-vis F&B stocks. Tosun (2022) report that, while investors traded more lodging stocks, they bought more share of F&B stocks during the COVID Pandemic. Chen et al. [2018] observe a momentum factor in hotel stock returns in Taiwan, but Ahmed [2022] report positive but insignificant momentum returns in the US hospitality and tourism sector. He argues that this finding could be interpreted as price reversal caused by noise traders who commit systematic and behavioral errors, such as overreaction to news.

Together, the findings of prior research suggest that investors react differently to news arrival and performance of F&B stocks and lodging, and our study seeks to document the information transmission between these 2 key sectors in the hospitality industry. Maroble and Kansheba [2022] employ a DCC-GARCH model to investigate volatility spillovers across four sub-sectors in the US hospitality industry; however, the focus of their analysis was volatility spillovers during the COVID pandemic.

We study the determinants of cross-sector conditional correlations and test for information transmission to the conditional correlation between F&B and Lodging stocks during the most recent 10-year period, January 2014 through December 2023. Studying cross-sector correlations is important for volatility estimation, asset pricing, and portfolio construction. We employ the Bivariate Logistic EGARCH (LEGARCH) model developed by Darbar and Deb [2002]. As Darbar and Deb [2002] argue, their bivariate Logistic EGARCH (LEGARCH) specification allows for direct tests of information transfers without having to impose additional restrictions on the variance. Our dataset consists of U.S. stocks of companies in SIC Codes 5812, 5813, 7011, and 7041. Businesses in SIC Codes 5812 and 5813 comprise our F&B Stock Index and SIC Codes 7011 and 7041 comprise the Lodging Stock Index. Daily stock returns are collected from CRSP for the 10-year period January 2014 through December 2023.

TEA TOURISM AND COFFEE TOURISM IN AFRICA: NICHE TOURISM AVENUES FOR TOURISM RECOVERY

Abstract

Tourism is one of the world's largest industries and its big business. Tourism has positive economic impacts and countries seek these benefits such as labour intensive jobs, attracting foreign exchange, the taxation of foreigners and benefiting other industries such as agriculture and construction. The tourism industry has strong linkages within the economy, through its multiplier effect. African countries when they cater for tourists, they benefit disproportionally as tourism diversifies their economies. Africa however continues to attract less than 10% of international tourism receipts, due to a plethora of structural challenges such as poor image, tourism unfriendly restrictions and regulations. Increasing tourism arrivals to Africa is imperative if tourism will become the economic growth panacea for many African countries. The majority of African countries sell themselves on the wildlife experience and sea, sand and sun experiences. Special interest tourism has the potential to diversify the tourism offerings that the African can present to international tourism markets seeking to attract more tourists.

Special interest tourism has emerged as a panacea against the negative impacts of mass tourism. Tea tourism and coffee tourism are theoretical frameworks that are expanded upon which are niches that are yet to reach their full potential on the African continent. The interface between tourism and agriculture is unpacked through tea tourism and coffee tourism. Tea tourism and coffee tourism are theoretical frameworks that are expanded upon, as niches

that are yet to reach their full potential on the African continent. Africa is the third largest producer of tea in the world and the well-developed tea plantations, presented the opportunity to develop tea tourism in destinations such as Senegal and South Africa. Attaya which is consumed as part and parcel of normal of Senegalese life, is a local tea culture that would assist to diversify tourism to Senegal. South Africa's Rooibos produced in the Cederberg has gained international prominence because of its health benefits. The Rooibos Route has developed alongside Rooibos production, developing into a full-fledged tourism route. Coffee tourism is big in Cameroon, which hosts the largest coffee festival in Africa called Festicoffee. Uganda has diversified its tourism offering which was focused on gorilla trekking by integrating coffee routes around Siphi Falls. The literature reviewed documents the tea tourism and coffee tourism experiences that could diversify the tourism product offerings for several African countries.

Keywords: Tea Tourism, Coffee Tourism, Rooibos Tea, Cameroon, Uganda, Siphi Falls, South Africa

CAPITAL STRUCTURE AND CORPORATE PERFORMANCE: EVIDENCE FROM TOURISM AND HOSPITALITY INDUSTRY

Reena Bhattu Babajee

University of Mauritius

Capital structure plays an important role in service sector like hotel industry. Abor (2005) explained that capital structure of an organisation refers to the long term financing of a company. It is determined by the long-term debt and equity capital used by the business enterprise. As a matter of fact, the capital structure of a business enterprise should be ideal, i.e., according to the requirement of the business enterprise. The capital structure is basically the firm's debt and equity, that is, what the firm uses to finance its operations. This can be in the form of equity or debt. The decision on the capital structure that a firm is going to take on is basically coming up with ways of maximising the value of the firm. The proportion of short-term and long-term debt is considered in analysing a firm's capital structure. When people refer to capital structure, they most likely are talking about a firm's debt/equity ratio, which provides insight into how risky a company is. Usually a company financed heavily by debt poses greater risks because it is highly leveraged.

Capital structure is one of the factors that impact on firm performance. This was best explained in terms of the trade-off between cost and benefits associated with increasing the debt in the capital structure of an organisation. Since bankruptcy costs exist, deteriorating returns occur with further use of debt in order to get the benefits of tax deduction. Therefore, there is an appropriate capital structure beyond which increases in bankruptcy costs are higher than the marginal tax-sheltering benefits associated with the additional substitution of debt for equity. Firms are willing to maximise their performance, and minimise their financing cost, by maintaining the appropriate capital structure or the optimal capital structure. Trade off theory was put forward by Scott (1977) demonstrating that as the increase of the ratio of bonds, the risk of the company will also increase, thus raising the bankruptcies, then decreasing the value of the company. Therefore, the optimum capital structure of company should be the equilibrium point caused by financial crisis cost and bankruptcy cost between section tax benefit and the rise of ratio of debt capital.

This paper analyses the impact of capital structure on the corporate performance of firms in the hospitality sector in Mauritius. Using the dynamic panel vector autoregressive model (PVAR) and considering a sample of 43 Mauritian hotels for the period 2009 to 2020, this study uses the debt to equity ratio as proxy for capital structure while return on assets (ROA) and Return on equity (ROE) are used as firm's performance indicators. Apart from these, some control variables such as firm size, liquidity, tangibility and growth are also included. Among the control variables, only size revealed a negative relationship with firm performance. The study finds that capital structure has a statistically significant negative impact over corporate performance of this sector, which confirmed findings of most of the existing literatures. This suggests that firm agency issues that lead to a high-debt policy may result in diminished firm performance. The findings of this study support the Peaking Order Theory of capital structure.

The outcomes of the study will have ramifications for the managers and policymakers responsible for decision making to enhance performance and will drive them to consider the influence of debt financing on performance before deciding the debt level. This study result suggests that as debt financing can have a significant adverse effect on firm profitability, managers should moderate leverage in order to maximise shareholder wealth. Indeed,

as debt is more costly than equity, managers should keep debt levels lower and instead focus financing at the margin on internal sources such as retained earnings and new equity, using external funding only as a last resort. The study results should provide policymakers with a better understanding of the relationship between corporate capital structures and performance, thereby underpinning future policy formulation.

DOES TOURISM ARRIVAL INFLUENCE RESIDENTIAL LAND PRICES?

Narvada Gopy-Ramdhany

Department of Finance and Accounting

University of Mauritius

Boopen Seetanah

Department of Finance and Accounting

University of Mauritius

This study aims to find how the number of hotels and tourism arrivals has been affecting residential land prices in Mauritius. Both tourism and residential real estate prices have been on the rise in Mauritius. The Mauritian context has been chosen to enhance the knowledge of the link between tourism and real estate prices in an island economy context. Considered one of the main economic pillars in Mauritius, since the 1990s, the tourism industry has maintained its impetus. The number of tourist arrivals has been increasing, situated at around 115,000 in 1980, it increased to 1.4 million in 2019 and to around 1 million in 2022. The number of hotels in Mauritius has also been on the rise, from 43 hotels in 1980, 103 hotels in 2004, and 112 hotels in 2019.

Coastal regions in Mauritius are perceived as the main tourist attractions, where most of the hotels are situated. There has been an increase in the demand for coastal land for the setting up of hotels and other infrastructures such as apartments and villas, among others; commonly booked by tourists for their holidays. Prior studies (for example, Nakamura and Saita, 2007; Davis and Heathcote, 2007) have commonly identified residential land prices to depend upon macroeconomic and demographic factors such as interest rate, unemployment, economic growth, income and population size, among others. On the supply side, the number of residential permits approved is commonly used.

Both a dynamic approach (namely an autoregressive distributed lag, ARDL) and a structural time series analysis were used to measure the influence of the aforementioned variables, as well as tourism and the number of hotels, on land prices. Using both methodologies, tourism was found to have a positive and significant influence on residential land prices. Whereas the number of hotels was insignificant in explaining residential land prices. This could be justified by the fact that the increasing number of tourists has increased the demand for accommodation and the tourists stay in other structures apart from hotels. Hence, the demand and use of residential properties as lodging for tourists has been increasing.

ABSTRACT

Tourism, when properly developed, managed, and marketed, may lead to significant economic, socio-cultural, and environmental benefits to a country. As tourism demands the development and existence of sustainable infrastructure, structure, and superstructure for it to be considered an established and productive sector at a destination, some of the major components that is crucial at all levels are security, stability, and positive diplomatic and peaceful relations with other countries. Without such specified factors, destinations tend to face frequent obstacles to properly develop, manage, and market themselves to the outside world. Frequent political crises, internally, such as conflicts between local political parties, and with other countries, negatively impact the destination's tourism industry leading it to perform at a much lower level than its proper capacity (e.g., shorter stays, travel warnings, shorter seasons, less tourist expenditures, less visitors, limited market segments, etc.). In many cases, political crises, and instability, internally and externally, may lead to the development of economic crises which destinations may find it very difficult to emerge from successfully as they diminish the performance of their tourism products and services. Amid the different crises, the destination may start suffering from a negative image which may find it very difficult to overcome. Such a scenario may leave the destination with significant losses at the economic, socio-cultural and environmental levels as its tourism sector may drift away from proper practices to survive and fall into unsustainable practices.

Numerous research studies focused on the importance of security, stability, peace, and relations and cooperation with other countries, including neighboring ones, for tourism to develop and prosper (Timothy & Teye, 2004; PETROVIĆ & MIRKOVIĆ, 2011; Dunets, Ivanova, and Poltarykhin, 2019; Gelbman, 2019; Kazakova & Kim, 2021). Interestingly, several studies demonstrated, often overlooked, the importance of tourism inflows from neighboring countries and its substantial contributions to destinations' prosperous tourism sectors. Studies stressed that peaceful and cooperative relations between neighboring countries may positively contribute to the well-being of societies in such destinations and beyond at the socio-cultural, economic, and environmental levels. In the meantime, several research studies focused on the detrimental effects of conflicts, wars, and terrorism on destinations, including their tourism sectors and how peace may reverse negative consequences, including on tourism sectors (Yaya, 2009; Alsarayreh & Jawabreh, 2010; Baker, 2014).

The purpose of this research study to is to examine best practices on cooperative regional efforts, including neighborly relations in selected continents of the world. The focus will be directed to the mutual beneficial and positive impacts of such practices on the state of tourism, including overall economic, socio-cultural, and environmental desirable consequences on destinations and their inhabitants. It is hoped that this study by shedding the light on the positive impacts that stem from best practices cases will draw more interest from destinations that lack such a reality to work towards a positive goal for the sake of their inhabitants and prosperity. The study will present practical and theoretical recommendations.

Keywords: peace, tourist destination, neighbors, tourism, cooperation, economic

ABSTRACT

The aftermath of the COVID-19 pandemic has prompted a paradigm shift in the tourism industry, necessitating innovative approaches to ensure both safety and exceptional travel experiences. Against the backdrop of a world defined by post-pandemic realities, this study aims to uncover the mechanisms through which technology can contribute to reviving the nation's tourism sector. Employing a systematic review methodology, we synthesize pertinent peer-reviewed literature and case studies. This approach provided a comprehensive understanding of the multifaceted aspects of technology adoption within the specific context of South African tourism.

Keywords: COVID-19, Tourism, Digital Transformation, South African Tourism, Technology Adoption.

INTRODUCTION

The COVID-19 pandemic has unleashed a seismic shift in the global tourism industry, compelling it to adapt swiftly to an altered reality (Smith et al., 2022). As travelers around the world yearned for both safety and exceptional experiences, the tourism sector confronted the urgent need for innovative approaches that would not only meet evolving demands but also ensure visitor well-being (Sigala et al., 2021). Research has consistently emphasized the urgency of these innovations, highlighting the adoption of advanced technologies, contactless services, stringent health and hygiene protocols, and personalized experiences as integral components of the industry's response to this unprecedented challenge (Chatzoglou et al., 2023). Within the intricate tapestry of global tourism, South Africa stands out as a vibrant and diverse destination with an eclectic array of attractions (Van der Merwe et al., 2022). Yet, the disruptions caused by the pandemic resonated deeply within its tourism sector, necessitating adaptive measures to revitalize and fortify the industry (Mbaiwa et al., 2020). Among these measures, the integration of digital infrastructure and technologies emerges as a paramount driver of the sector's recovery trajectory (Ribeiro et al., 2021). This research embarks on a comprehensive exploration, aiming to unravel the intricate relationship between technology adoption and the reinvigoration of South Africa's multifaceted tourism landscape. Amongst the advanced technological main concepts and programmes adopted during the aftermath of COVID-19 within the tourism industry that will be examined are Blockchain (BC) Technology, Digital Infrastructure, Virtual Reality (VR) and Augmented Reality (AR), Information and Communication Technologies (ICTs), Smart Tourism and Technology Acceptance Model (TAM).

In a world reshaped by post-pandemic realities, this study endeavors to uncover the mechanisms through which technology can contribute to the resurgence of South Africa's tourism sector. By employing a systematic review methodology, the study intends to synthesize a wealth of pertinent peer-reviewed literature and case studies (Buhalis et al., 2021). This approach is designed to provide a holistic understanding of the multifaceted facets of technology adoption within the unique context of South African tourism. This study is particularly significant as it delves into the immense challenges the pandemic posed to the tourism industry as well as the opportunities for the industry to innovate and transform (Gössling et al., 2021). In this context, South Africa's tourism sector finds itself at a critical position, where embracing technological advancements not only promises to enhance visitor safety but also holds the potential to catalyze long-term growth, making it a resilient and tech-savvy tourism destination.

The study is guided by the following objectives:

- To assess the extent of digital infrastructure development and technology integration in South Africa's tourism sector post-COVID.
- To analyze how digital tools such as high-speed internet, mobile apps, and contactless solutions are enhancing the overall travel experience for tourists
- To investigate the impact of technology adoption on visitor safety perceptions, destination choices, and tourism demand

THEORETICAL FRAMEWORK

Technology Acceptance Model (TAM)

The TAM framework has been widely recognized and validated as a theoretical model for explaining consumption behaviour in computer-mediated environments (Porter & Donthu, 2006; Bruner & Kumar, 2005). TAM is rooted in the theory of reasoned action (Fishbein & Ajzen, 1975) and is designed to assess an individual's acceptance of information technology. This model postulates that perceived usefulness (PU) and perceived ease of use (PEOU) are pivotal external factors that determine an individual's attitude toward using information technology. Perceived usefulness is defined as "the degree to which a person believes that using a particular system would enhance his or her job performance," while perceived ease of use is defined as "the degree to which a person believes that using a particular system would be free of effort" (Davis, 1989: 320). TAM asserts that both PU and PEOU significantly influence an individual's attitude toward an object, and in turn, attitude, along with PU, influences behavioural intention sequentially. These external factors (PEOU and PU) essentially mirror individuals' beliefs regarding a specific technology (Huang, 2016).

The widespread adoption of TAM in various research domains can be attributed to its explanatory power and simplicity. It has been shown to be particularly effective in explaining over fifty percent of the variance in behavioural intentions (Huang, 2016). Moreover, TAM has demonstrated its adaptability by being extended and integrated with theories from different disciplines, including the field of tourism (Wu et al., 2020). Notably, TAM has been considered the most competent model for explaining the adoption of technological innovations (Wang et al., 2020) and is widely utilized in studies related to technology adoption tendencies (Huang, 2016).

In the context of this study on the Acceleration of Technology Adoption Post-COVID in the tourism industry, TAM serves as a valuable theoretical framework. It allows for the exploration of how tourists and tourism practitioners perceived usefulness and perceived ease of use of technology influence their attitudes and intentions toward adopting technology solutions within the South African tourism sector in the post-COVID era. This framework has been successfully applied in various contexts, including online consumer behaviour, e-commerce, and travel decision-making, making it a robust choice to examine the role of technology adoption in the tourism industry's recovery and adaptation in South Africa.

METHODOLOGY

This study uses a systematic literature review on technology adoption within the tourism sector, with a particular focus on the post-COVID era. The study primarily concentrated on research conducted between 2021 and 2023 to ensure contemporary insights and relevance. A screening process was applied, guided by the following inclusion criteria:

- Temporal Range: Papers published between 2021 and 2023 were considered, allowing for a contemporary focus while capturing relevant developments in technology adoption in tourism and COVID era.
- Relevance: Articles with a semantic connection to the research area and containing the specified keywords were incorporated into the study.
- The search for relevant articles was conducted across various reputable database sources, namely Emerald, IEEE Explore, Science Direct, Google Scholar, Taylor and Francis, Springer, and the Web of Science. These databases were chosen for their wide coverage of academic research.

This methodological approach not only facilitated the construction of a comprehensive and rigorously chosen literature archive but also established a robust foundation for the subsequent analysis of technology adoption within South Africa's post-COVID tourism sector. It enabled the inclusion of the most current and relevant research findings, aligning seamlessly with the study's objectives and its temporal context (Mengist, Soromessa, & Legese, 2020).

RESULTS AND CONCLUSIONS

Innovative Approaches in Tourism Post-COVID:

The adoption of advanced technologies in the tourism sector has ushered in a new era of travel experiences, and this transformation has been particularly profound in the aftermath of the COVID-19 pandemic. Smith et al. (2023) highlight how technologies such as augmented reality, virtual reality, and artificial intelligence have redefined the way tourists engage with destinations. Travelers can now embark on virtual tours, explore attractions from the comfort of their homes, and receive personalized recommendations tailored to their preferences, all of which have become instrumental in reshaping the tourism landscape. Contactless services, as emphasized by Jones et al. (2020), have emerged as an indispensable aspect of ensuring traveller safety and confidence in the wake of the pandemic. Travelers are increasingly opting for contactless check-ins, digital payments, and touchless access to amenities to minimize physical contact during their journeys. This shift not only addresses health concerns but also enhances the overall travel experience by streamlining processes and reducing wait times. In response to the health crisis, the hospitality industry has adopted stringent health and hygiene protocols, as noted by Brown & Clark (2023). The integration of advanced technologies, contactless services, and stringent health measures not only enhances traveller safety but also revitalizes and evolves the tourism sector. As the world adapts to the challenges of the post-COVID-19 era, these elements will continue to shape the future of travel, offering tourists innovative, safe, and unforgettable experiences.

South Africa's Tourism Sector in the Pandemic Context:

South Africa boasts a remarkable blend of cultural richness and natural beauty and has l positioned itself as a prominent tourist destination. The diverse attractions, from the iconic Table Mountain to the wildlife safaris in Kruger National Park, have consistently attracted tourists from across the globe (Smith & Johnson, 2019). However, the outbreak of the COVID-19 pandemic in 2020 shook the foundations of South Africa's thriving tourism industry. The country's reliance on international tourism became evident as it faced a staggering decline in tourist arrivals due to travel restrictions and safety concerns (Moodley & Naidoo, 2022). This sudden downturn had adverse economic effects, with tourism-related businesses struggling to survive amidst uncertainty and reduced visitor numbers.

To circumvent these unprecedented challenges, South Africa's tourism sector embarked on a journey of adaptation and revitalization. Recognizing the critical need to ensure tourists safety, the government and industry stakeholders swiftly implemented comprehensive health and safety protocols (Jones et al., 2021). These measures encompassed rigorous cleaning practices, health screenings, and adherence to international standards to reassure visitors and rebuild trust. Additionally, to address the immediate need for tourism, a strategic shift towards promoting domestic travel was undertaken. Various initiatives, such as domestic tourism campaigns and discounts, were introduced to stimulate local tourism and provide a lifeline to struggling businesses (Jones et al., 2021). Concurrently, the industry explored innovative strategies to remain relevant in the eyes of international tourists. Digital tools and technology adoption, including virtual tours and digital marketing, played a pivotal role in keeping South Africa's diverse offerings visible to the world (Jones et al., 2021).

Digital Infrastructure Development in South African Tourism

The state of digital infrastructure in South Africa plays a pivotal role in shaping the tourism sector's future. South Africa, like many emerging economies, faces challenges in achieving innovative digital infrastructure (Smith et al., 2022). While investments in high-speed internet have been made to address this issue, disparities still exist, with urban areas enjoying better connectivity compared to remote regions (Moodley & Naidoo, 2022). The impact of these investments on the tourism sector is significant, as reliable internet connectivity is essential for various aspects of the tourist’s journey, from research and booking to navigation and sharing experiences (Makkar et al., 2022). Mobile apps have emerged as powerful tools for enhancing the travel experience by providing real-time information, convenience, and personalized services (Garcia & Davis, 2021). However, the effectiveness of these apps is closely tied to the availability of high-speed internet and digital infrastructure, making it imperative for South Africa to address these disparities for the benefit of both domestic and international tourists (Jones et al., 2021).

Digital technologies have radically changed the way that tourism destinations are marketing online and have revolutionized the rules of marketing (Magano & Cunha, 2020, Jiménez-Barreto, Rubio, Campo & Molinillo, 2020, Chamboko-Mpotaringa, Tichaawa, 2021). Angeloni & Rossi, 2020; Cranmer et al., 2020) posit that using digital marketing technologies wisely improves an organization's marketing efforts and lowers marketing

expenses. In an increasingly technologically advanced world, where tourism offerings providers have greater access to e-marketing channels due to their increased possession of necessary technology equipment, digital marketing for tourism is the most intriguing and quickly expanding form of marketing (Chamboko-Mpotaringa and Tichaawa 2021; Valeri, 2022; Valeri and Katsoni, 2021). The corporate environment has evolved as a result of the digitalization of marketing systems as a whole (Deb, Nafi, Valeri, 2022).

Technology Adoption and visitor experiences

The adoption of technology in South African tourism has significantly transformed the way tourists experience the country's diverse attractions. Adeola & Evans, (2020), Nafrees & Shibly (2021) and Musah, Yakubu & Shaibu, (2023) reveal that information and communication technologies (ICTs) have had a major impact on the tourism sector across the globe and South Africa and, it continues to be the main forces behind innovation in the sector. The research demonstrates that information and communication technologies (ICTs) have radically transformed how tourism offerings are made, perceived, and delivered to the market. The travel experience has been mediated by ICT (Tahir & Pribadi, 2021). Additionally, ICT has transformed the way in which the destinations visited, and experiences related to social building are understood in three stages: prior to, during, and after the trip. ICT has had a substantial impact on how tourists choose their modes of transportation, accommodations and activities when visiting a certain destination (Tahir & Pribadi, 2021). It follows that by increasing tourists demand and income, ICT enables tourism destinations to strengthen their online presence, which is imperative for them to stay competitive in the global tourism market (Bano et al., 2022 and Musah et al., 2023).

The primary indication that the tourism industry anticipates from smart tourism is the concentration on smartphone technology; additionally, smart tourism encourages the adoption of cloud computing, wireless communication, and internet of things technologies (Nafrees & Shibly, 2021). Since 2014, the tourism and hospitality sector has been implementing Blockchain Technology (BC) to maximize benefits for all parties involved (Rana, Adamashvili & Tricase, 2022). A variety of actors, including hoteliers, airlines, travel agencies, tour operators, insurance companies, payment service providers, and others, who have complex business interactions and intense competition with one another, are generally what define tourism. Therefore, utilizing BC in conjunction with other technologies-like ICT, AI, smartphones, mobile devices, etc. - can minimize these challenges and raise the caliber of services provided to tourists (Irannezhad & Mahadevan, 2020).

Virtual reality (VR) and augmented reality (AR) technologies have emerged as powerful tools for showcasing South Africa's cultural and natural wonders. These immersive technologies allow prospective tourists to explore historical sites, wildlife reserves, and scenic landscapes from the comfort of their homes, creating a sense of anticipation and excitement even before they set foot in the country (Smith et al., 2022). Real-time updates on safety measures, weather conditions, and nearby attractions through mobile apps empowers tourists with valuable information, enabling them to make informed decisions about their travel experiences. Location-based services further enrich the visitor experience by providing personalized recommendations and guiding tourists to hidden gems and off-the-beaten-path destinations (Garcia & Davis, 2021).

Challenges and Barriers in Technology Adoption in Tourism Industry

The adoption of technology in South African tourism, is growing; however, it faces a number of challenges and barriers that need to be addressed for sustainability. South Africa faces diverse challenges in terms of infrastructure limitations and digital divides (Makkar et al., 2022). Together with the anticipated increased development and implementation of VR technologies, the most major change regarding accelerated digitalization is the relocation of tourism experiences to online platforms as a result of the COVID-19 (Brozović & Saito, 2022). Tourism businesses must overcome related challenges, such as the issue of the commercialization of virtual tourism experiences, in order to implement these changes. VR experiences are currently offered for free, so turning them into a paid service could be a major challenge to tourism organisations.

Disparities in internet access, especially in rural and remote areas, pose a significant hurdle to the widespread adoption of technology. Bridging the digital divide through improved connectivity and accessibility is crucial to ensure that the benefits of technology adoption are equitable across the country. Additionally, there is a need for South Africa to enforce policies that facilitate the integration of technology into the tourism sector while safeguarding privacy and security (Bieger et al., 2020). Regulatory frameworks need to strike a balance between encouraging innovation and ensuring compliance with industry standards, particularly in areas related to data protection and cybersecurity. Lastly, resistance to change within the industry and among stakeholders is an impediment to technology adoption. Overcoming resistance requires comprehensive education and awareness campaigns to showcase the benefits and potential of technology in enhancing the tourism experience, improving safety, and increasing operational efficiency.

Wang, Zhen, Tang, Shen & Liu (2022), posit that even though smart tourism has made progress in the developed and emerging countries such as China, there are still major challenges and barriers that need to be addressed. One evident challenge is that the low rate of use of smart facilities is a result of hardware infrastructure built without consideration for the needs of tourists. Irannezhad and Mahadevan (2022) reveals that regardless of many benefits and ability to progress the tourism industry, BC technology is marked by certain challenges. For example, there's a chance of hacking assaults. The perfect construction of the smart-contract code is essential to preventing hackers from taking advantage of material and using it for their own gain, including financial or private data. The disparity in smart tourism levels between urban and rural areas, as well as between eastern, central, and western regions, has also been noted as a problem. Furthermore, China faces challenges including poor data resource utilization and a dearth of originality with intelligence at its core. In addition, privacy and security concerns provide a significant challenge to smart tourism (Wang et al., 2022).

Valeri and Baggio (2021) stress that regardless of technical barriers, many strategic challenges have attached the BC implementation since it still a new phenomenal and unexplored technology. The authors further reveals that there is little research conducted by academics and practical cases of BC implementation in the tourism industry, and it is recommended that researchers write and publish more studies in this subject. Business systems have challenges as a result of recent advancements in digital technologies (Sanasi et al., 2021). Increasing unemployment, health problems, economic crises, and price increases have been the most prevalent difficulties in

the modern world. These elements prompted the service providers to deliver goods and services in an economical manner (Alkhatib & Valeri, 2022; Santos et al., 2021).

CONCLUSION

The COVID-19 pandemic has brought in a new era of rapid technological adoption and innovation within the global tourism industry, and South Africa's tourism sector, renowned for its cultural diversity and natural beauty, has been no exception to these transformative changes. This paper has explored the intricate connection between technology adoption and the rejuvenation of South Africa's tourism landscape in the post-COVID era. The comprehensive literature review conducted in this study unveiled several significant findings. The study concludes that innovative approaches in tourism, driven by technology, have revolutionized the way tourists engage with destinations. Augmented reality, virtual reality, artificial intelligence, and contactless services have become integral facets of the travel experience, offering tourists safe, immersive, and unforgettable experiences. Additionally, South Africa's tourism sector, like its global counterparts, faced substantial challenges during the pandemic. However, the industry showcased remarkable adaptability by implementing rigorous health and safety protocols, promoting domestic tourism, and harnessing digital tools and technology adoption to remain visible to international tourists. Furthermore, technology adoption has profoundly impacted visitor experiences. Virtual reality and augmented reality technologies enable prospective tourists to explore South Africa's attractions remotely. Mobile apps offer real-time information, convenience, and personalization, enriching the overall visitor experience. Finally, the adoption of technology encounters a number of challenges and barriers, encompassing infrastructure limitations, digital divides, regulatory considerations, and industry resistance to change. Overcoming these hindrances is instrumental in sustaining and maximizing the advantages of technology adoption within South African tourism.

INTERNET TRAVEL BOOKINGS IN THE FACE OF ONLINE TRAVEL AGENCY SCAMS: TOWARDS PROTECTING TRAVEL CONSUMERS.

Mr. Lehlohonolo Gibson Mokoena

Central University of Technology, Free State

Republic of South Africa, Email: lmokoena@cut.ac.za

orcid.org/0000-0002-1936-0159

Abstract

Traditional travel intermediaries have always been the "go-to guy" for arranging travel services, and with the internet, consumers today can make independent purchasing decisions. However, many consumers fall prey to the travel scams of "travel agency sharks" on the internet. How does one distinguish between a legit travel agency and a fraudulent one? Moreover, what is the impact of these scams on the sector? The purpose of this paper is, therefore, to find ways to curb this corrosion. The study followed a qualitative approach, and the population included n=19 travel agencies registered with the Association of Southern African Travel Agents (ASATA), and semi-structured interviews were used to gather data. The results indicate that the travel agency operation still needs strict regulations, and there is also a great need for education and awareness on the side of the consumers in terms of the services of a travel agency. This study contributes to the gap that exists in travel agency literature, research on online travel agency frauds and possible mitigating factors.

RESEARCH ON HIGH QUALITY DEVELOPMENT OF TOURISM DESTINATIONS UNDER BLOCKCHAIN TECHNOLOGY

ZHAO YINGKUI

Guang Xi Normal University

ABSTRACT

The production data and information data of tourists show a trend of explosive growth, but in specific research, it has been found that there are phenomena such as "bias" and "ambiguity" in the information that fill the network, resulting in inappropriate effects on the high-quality development of tourism destinations. To improve the above issues, blockchain technology has brought new opportunities and challenges to the development of tourism destinations. This article discusses three aspects: theoretical modeling and algorithm analysis, field application and field innovation, and practical path and strategy research. Based on blockchain technology, research is conducted on the high-quality development of tourism destinations, ensuring the efficiency, authenticity, and legality of tourism destination data information, reshaping traditional tourism destination management models, and achieving loyalty management of tourists to tourism destinations. Therefore, it is recommended to strengthen the cultivation of blockchain technology talents in the tourism industry and the construction of blockchain products in tourism destination areas, introduce blockchain management systems and laws and regulations, actively guide tourism destination enterprises to reshape their corporate culture, adapt to the new concepts of contemporary tourist consumption needs, and actively respond to technological changes in the digital age.

REFRAMING DIVERSITY, EQUITY, AND INCLUSION IN THE OUTDOOR INDUSTRY: A 'SYSTEMS' PERSPECTIVE

ABSTRACT

Drawing on participatory action research principles, this qualitative study examines factors that influence the diversity, equity, and inclusion (DEI) practices of outdoor businesses. Forty virtual interviews and three focus groups were held with a range of stakeholders, namely employers, industry experts, employees, and aspiring employees. Template analysis was undertaken. Findings highlight various multiple-level factors that weaken businesses' DEI efforts. These include employment barriers for minorities, low industry image and work conditions, fragmented remuneration and industry structure, amongst others. Developing a diverse, equitable and inclusive outdoor industry is a complex initiative that requires a multi-pronged approach.

KEYWORDS: Australia, DEI, outdoor industry, participatory action research, systems thinking.

INTRODUCTION

Calls for a sustainable HRM agenda in the tourism, hospitality and outdoor industry have grown exponentially over the years. Underpinned by the International Labour Organization's decent work agenda and the UN Sustainable Development Goals No. 8 and 5 (centred around decent work and gender equality), social sustainability in HRM requires the adoption of an employee-centric philosophy which places values of justice, inclusion, engagement and well-being at the core of decision-making processes (Ehnert Aust et al., 2020; Gamage et al., 2023). At the core of the sustainable HRM agenda is a stream of work on diversity, equity, and inclusion

(DEI). Although DEI is used as an umbrella term, each pillar has its own meaning. Diversity refers to the representation of culturally different individuals and groups in one social system. Inclusion is concerned with the recognition and belonging of individuals into organizational processes (e.g., through information and resource access and individuals' ability to influence decisions) (Im et al., 2023; Mor Barak et al., 2016). Equity places emphasis on the distribution of rewards and outcomes (Im et al., 2023).

Compared to mainstream management literature, DEI research lags in the tourism, hospitality, and outdoor industry. DEI-tourism scholars have mainly applied a diversity management lens aimed at enhancing representational workforce diversity (Im et al., 2023; Kalargyrou & Costen, 2017). Significant knowledge gaps are therefore apparent in the DEI-tourism body of work. These include a lack of theoretical foundations and empirical evidence regarding DEI influence (Kalargyrou & Costen, 2017; Manoharan & Singal, 2017), a limited range of stakeholders in DEI efforts (Im et al., 2023), and a lack of contextual understanding of DEI implications at the industry level of analysis.

Our study explores DEI within the context of businesses operating in the outdoor industry in the state of Victoria, Australia. More specifically, it examines factors that influence DEI practices of outdoor businesses. The outdoor industry is inclusive of recreational settings (outdoor recreation), tourism settings (outdoor nature-based tourism), adventure experiences (outdoor adventure) and therapeutic experiences (adventure and nature-based therapy) (Cox, 2022). Our study addresses the above-mentioned literature gaps in two ways. First, we draw on *systems thinking theory* to inform a holistic understanding of the DEI phenomenon and practice in outdoor organisations and industry. According to systems thinking theory, systems are made up of interconnected and interdependent parts that are ideally synchronized to support the whole system. Furthermore, small changes in one element of the system can create substantial change if the leverage points are clear (Hodgson, 2019; Roxas et al., 2020). Viewing the outdoor industry as a complex system where various stakeholders interact facilitates broader discussions on the interplay between industry-level forces and organisational-level DEI efforts. Second, our study is underpinned by a *multi-stakeholder approach* which advocates for ongoing engagement with stakeholders who affect or are affected by DEI programs. This approach is reflected through our research methodology (discussed below).

Considering the lack of research on DEI in the outdoor industry, our study adopts a qualitative research design grounded on participatory action research (PAR) principles. PAR seeks to situate power within the research process with those who are most affected by a program (Kemmis & McTaggart, 2007; Kindon et al., 2007). Qualitative primary data collection methods consisted of virtual interviews (n = 40) and virtual focus groups (n = 3). A stratified purposeful sampling strategy (Miles & Huberman, 1994) was applied. The sampling frame was first divided into four strata – namely employers, industry experts, employees, and aspiring employees – and a purposeful sample was selected across each stratum. Table 1 provides an overview of the primary data collection strategy and sample, whilst Table 2 sets out the demographic profile of interview participants.

Data source	Focus group No. 1 (one-hour session)	Individual one-hour interviews (n = 40)	Focus group No. 2 (two-hour session)	Focus group No. 3 (two-hour session)
Timing	10th November 2022	Between September 2023 to January 2024	1st October 2023	14th December 2023
Scope	Confirming the research design; and sourcing contextual industry information	Undertaking in-depth, semi-structured interviews across key stakeholder groups	Validating preliminary research findings; actively involving stakeholders in line with PAR; and sourcing information	Undertaking 'member reflections' (Smith & McGannon, 2018); maintaining stakeholder engagement in line with PAR ; and sourcing information
Sample	10 industry experts/ employers	6 employers 7 industry experts 13 employees 14 aspiring employees	10 industry experts/ employers	6 employers 5 industry experts 10 employees 4 aspiring employees

[Table 2. Attributes of interview participants]

Interviews and focus groups were recorded and transcribed, and transcripts were checked for accuracy. Template analysis – which represents one of the codebook approaches to thematic analysis (Braun et al., 2019) – was conducted using the NVIVO software. As recommended by qualitative researchers (Brooks et al., 2015; King & Brooks, 2017), a priori codes were initially established following discussions amongst research team members. These codes were informed by the research objectives and previous literature. The template was further refined with ongoing data collection and analysis. The final version of the template consisted of three inter-related key themes, as outlined in Table 3.

Overall, our study provides evidence of how factors at multiple levels of analysis weaken businesses' DEI efforts. Developing a diverse, equitable and inclusive outdoor industry is a complex initiative that requires a multi-pronged approach. This requires government and industry investment in the professionalisation of careers, broader conversations around how to improve wages and conditions within the operational realities of outdoor businesses, and inclusive leadership representation and approaches.

No.	Key theme	Theme summary
1	DEI practices in outdoor businesses	➢ Scope of diversity: Diversity was linked to a wide range of dimensions, namely gender, sexual orientation, ethnicity, First Nations background, disability, and body size. The latter dimension extends the DIE literature and heralds the uniqueness of outdoor work experiences. ➢ However, a gap between organisations' DEI intentions and the DEI implementation was observed. Although businesses and industry stakeholders understood the strategic value of diversity management, DEI initiatives appeared to be framed around representational diversity as opposed to workplace inclusion. ➢ The lack of representational diversity at employee and board levels undermined businesses' ability to achieve workplace diversity objectives.
2	Individual-level factors influencing DEI practices in outdoor businesses	➢ Women: Female employees identified various work challenges associated to highly masculine outdoor workplaces, including bullying and sexual harassment, discrimination, lack of work-life balance especially for young mothers, and a lack of consideration for women's physiological and menstrual needs. ➢ Culturally and Linguistically Diverse (CALD) individuals: The lack of exposure to and fear of the outdoor combined with some communities' preference to academic and professional careers mean that CALD groups are not attracted to the industry as a career of choice. ➢ People with disability: Given the physical nature of the industry, people with physical disabilities faced significant employment barriers. At the same time, there was evidence of some businesses providing additional support for neurodiverse workers. ➢ Body diverse individuals: Body diverse interviewees reported employment barriers due to stigmatisation and a lack of representation across industry advertising and social media.
3	Industry-level factors influencing DEI practices in outdoor businesses	➢ Low industry image and work conditions – e.g., high workforce casualisation, lack of secure work, limited career progression opportunities, high work demands, low compensation, significant pay differentials across employers, and the lack of recognition of the work effort needed to deliver on place-based learning outcomes of programs – deterred diverse employee groups from joining and staying in the industry. ➢ Remuneration challenges seemed to be symptomatic of broader employment regulation issues around award classification. The absence of a dedicated industrial award to govern the minimum terms and conditions of work was said to create a breeding ground for patchy pay rates and subjective employer interpretation of job conditions. ➢ Fragmented industry structure and insular advocacy efforts: The lack of regulation, accreditation, coordination, and marketing contributes to the poor industry image and results in the industry being undervalued by the broader community. This, in turn, affects the industry's economic model and hinders pay review exercises.

[Table 3. Overview of key themes]

DETERMINING REASONABLE DEPOSIT AND CANCELLATION CHARGES IN TERMS OF THE CONSUMER PROTECTION ACT, 2008 IN THE HOSPITALITY SECTOR IN SOUTH AFRICA

Prof AM Tait

Faculty of Law

Nelson Mandela University

mark.tait@mandela.ac.za

The Consumer Protection Act 68 of 2008 provides consumers with the right to cancel advance bookings and reservations. This right therefore represents a significant departure from the common law rule of *pacta sunt servanda* as foundational principle of the South African law of contract. The right places the consumer in a strong position in relation to the service provider. A consumer can – without reason – cancel a booking or reservation and this may create challenges for service providers such as providers of hospitality services, including providers of accommodation and attractions' services.

The service provider is not without protection. The Act provides that a service provider may require payment of a *reasonable* deposit when a booking or reservation is made, as well as impose a *reasonable* cancellation charge in the event of a cancellation of an advance booking or reservation. The question arises what constitutes a reasonable deposit and a reasonable cancellation charge. The Act provides some guidance for determining what constitutes a reasonable deposit or cancellation charge. Four factors that must be considered in determining reasonableness include the nature of the service, the length of the notice, an existing trade practice, and the reasonable potential of finding an alternative consumer. Although seemingly straight-forward, implementing the imperative of the Act to consider these factors when determining a reasonable deposit or cancellation charge is not a simple exercise.

The purpose of this paper is to consider these factors and then to propose a method that may assist service providers in calculating a deposit or cancellation charge on a rational basis rather than on a rule of thumb-basis. The method suggested entails developing a scorecard in terms of which the different factors are weighted in accordance with its relative importance. In doing so service providers may be assisted and complying with the Act and provide consumers with transparency on how these charges are determined. As part of this process the relationship between the payment of a deposit and a cancellation charge is also considered.

It will be submitted that the method proposed may not be a perfect solution but may be start in developing a method that will benefit both consumers and service providers and avoid unnecessary

PEER-TO-PEER ACCOMMODATION'S IMPACT ON WOMEN'S EMPOWERMENT: AN INTEGRATED MODEL

Mandla Sibisi
University of Johannesburg
mandlasib@uj.ac.za

Robin Nunkoo
University of Mauritius
r.nunkoo@uom.ac.mu

Abstract

Peer-to-peer accommodation sharing platforms have been commended for their ability to propel Sustainable Development Goal 5. Research on these platforms recognize their contribution to women's empowerment and the advancement of inclusive tourism development. Indeed, women constitute the significant proportion of peer-to-peer accommodation hosts and existing literature on this topic has undoubtedly shed some light on our understanding of the impact of peer-to-peer accommodation on women's empowerment. However, studies have used the mere presence of women hosts in peer-to-peer accommodation and financial benefits gained from hosting as an indicator of women empowerment. Empowerment has multiple dimensions, therefore a single indicator is inadequate to be applied as a measure for women empowerment. Considering that multiple theoretical models tend to perform better as opposed to a single model, this study entwines the Resident Empowerment through Tourism Scale (RETS), World Health Organisation Quality of Life assessment instrument (WHOQOL), Weber's theory of formal and substantive rationality (WFSR), and the Theory of Planned Behaviour (TBP) to propose a unified and reliable conceptual model that can be adopted to comprehensively measure peer-to-peer accommodation platforms perceived value on women hosts. The study contributes towards the scant, yet growing literature on peer-to-peer accommodation linkage with women empowerment.

Adenike Adebayo

Liverpool John Moores University, UK

Abstract

Domestic tourism in global south destinations is a very interesting topic. Often countries focus on international tourism at the expense of developing their domestic market, which is the precursor of tourism development (UNWTO, 2013). For instance, in Nigeria recently, government implemented policies introducing visas on arrival and spent several millions of Dollars to improve infrastructure, chiefly transportation, to make Nigeria more attractive to travellers. While considerable efforts have been made to market Nigeria to international visitors, however, corresponding efforts have not been expended in developing domestic tourism despite it being a growth area. For example, in 2018, 12.79 million people travelled on domestic flights in Nigeria (Statista, 2022), not accounting for other modes.

The role and contribution of domestic tourism in the overall tourism development of destinations have variously been emphasised. Mutinda and Mayaka (2012) noted that domestic tourism accounts for 80% of tourism in the world and significantly support economies from the volatile international tourism business. UNWTO (2013) noted that domestic tourism is estimated to represent around 5 to 6 billion trips globally. In a more recent paper Stylidis, Belhassen and Shani (2017) pointed out that the segment accounts for over 70% of total tourist flow and represents 74% of total arrivals and 73% of total overnight stays.

Nigeria being the most populous nation in sub-Saharan Africa with population tending to 200 million is a perfect market to be explored for domestic tourism. Sanni and Chile (2018) noted that Nigerian millennials are driving the nation's domestic tourism and there has been a growth of small, social media-savvy travel companies targeting the millennial and associated markets. Whilst Nigerian holidaymakers are keen to explore their country, the image of the country, held by them, as tourism destination seems not clear (Sanni and Chile, 2018). It will be logical for destinations to start their marketing endeavour with their citizens particularly where the destination is not an established one because residents are more likely to look at their country more favourably than their international counterpart (Bonn et al., 2005).

Drawing on social identity theory (SIT) as a theoretical lens, this paper examines the influence of destination image and personality on residents' attitude toward domestic travel within Nigeria. The question is – are Nigerians traveling within Nigeria? The study also explores whether Nigerians living in the country have a significantly

more positive view of the country as a tourist destination than their compatriots who are in the diaspora. Based on SIT and exploration of the literature, nine hypotheses were formulated as depicted in Figure 1 below.

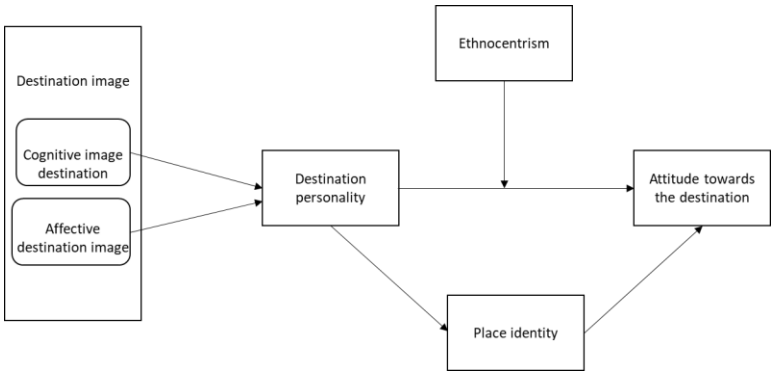

Figure 1 conceptual framework

Data were collected from Nigeria living in Nigeria and others in the diaspora via Jisc. A total of 221 useable questionnaires were realised after the exclusion of 11 unusable responses. Partial least squares structural equation structural modelling (PLS-SEM) using WarpPLS version 8.0 was employed in assessing the research model. Results revealed that in the context of Nigerian domestic tourism cognitive destination image (CDI) strongly influence destination personality (DP and in turn attitude toward the destination (ATD) more than affective destination image (ADI). Also, the Multi-Group Analysis (MGA) results revealed no differences between Nigerians living in the country and those in the diaspora in three direct hypothesised relationships: CDI→DP, DP→ATD and PI→ATD. One of the interesting implications that emerged from the study is that despite national pride Nigerian destination managers need to steer their strategy towards enticing domestic travellers' affective dispositions.

Key word: domestic tourism, civic pride, attitude towards travel, place identity, social identity

Abstract

This study determined the key aspects of entomophagy ecotourism product development for one of the culturally and entomophagy-rich areas in South Africa, the Mopani District. Qualitative research was conducted. The research used a non-probability sampling technique namely, convenience sampling. The findings show that entomophagy, the consumption of edible insects, is deeply embedded in Limpopo's local culture. Tourists, especially those from Asia and neighbouring countries like Zimbabwe and Botswana, play a vital role in sustaining this practice. Integration of entomophagy into ecotourism presents significant opportunities for economic growth, cultural preservation, and environmental sustainability in the region. There's a clear need for collaboration among stakeholders to promote, market, and educate tourists about the benefits of entomophagy within the context of ecotourism. The research made the following contributions: Firstly, it identified key aspects of entomophagy tourism product development for Limpopo Province. Secondly, this was the first time a study of this nature was ever conducted, contributing to the literature regarding entomophagy tourism research in South Africa and the rest of the world thirdly the research gives a comprehensive summary of the literature regarding product development for entomophagy tourism products. Keywords: Entomophagy; Ecotourism; Product Development; Economic Growth; Cultural Preservation

PERCEPTIONS OF HOSPITALITY STUDENTS ABOUT WORK-INTEGRATED LEARNING AS A SKILLS DEVELOPMENT IMPERATIVE

Dr. Vikelwa Nomnga

Walter Sisulu University

vnomnga@wsu.ac.za

Raphael Gwindi

raphygee@gmail.com

ABSTRACT

This abstract presents an overview of a study focused on exploring the perceptions of hospitality students regarding Work-Integrated Learning (WIL) as a crucial element for the development of work skills. This research aimed to uncover the perspectives of hospitality students regarding the importance and value associated with WIL in shaping their skill sets. The study also presents challenges experienced encountered during WIL. Through a qualitative approach involving semi-structured interviews, data were collected from a diverse sample of hospitality students. The findings revealed that the participants highlighted that WIL assists with perceived skills priority; advancement of soft and hard skills; importance of theoretical knowledge and practical application; enhancement of confidence, adaptability and problem-solving abilities; understanding workplace complexity; employability prospects; and cultivation of networks. However, certain challenges were also highlighted, such as the need for effective guidance during WIL placements and managing academic commitments alongside practical training.

Keywords: *hospitality, skills, skills development, students, work-integrated learning, work*

INTRODUCTION

Work integrated learning (WIL) has increasingly become an important process for students to be involved in the work environment. WIL is described as a process whereby students make use of their theoretical knowledge in the practical work environment (Lubbe & Svensson, 2022). WIL gives graduates exposure not only to the world of employment, but also to the anticipations in the industry (Kokt & Solomons, 2021). Lategan (2022) posits that several outcomes on assessments of students in several countries indicate that university graduates are not primarily attaining the kinds of skills necessary for the industry. By participating in WIL initiatives students are more likely to be exposed to practical situations which enhance their graduate skill, chances of employment as well as information of employment opportunities. The work industry, universities as well as students deem employability, graduate skill and employment opportunities as essential success elements for degree programmes (Lubbe & Svensson, 2022). WIL is a crucial component for the development of work skills. Deen and Tichaawa (2016) argue that WIL has been underlined as a crucial part in the blending of theory with practice in every vocational programme. The hospitality sector which is significantly service sector demands the efficient use of WIL to ensure that students become valuable to the industry.

Equipping prospective personnel in the hospitality sector in South Africa is important because as pointed out by Kokt and Solomons (2021) the sector is the biggest sector within the tourism industry. The South African hospitality sector plays a significant role in the country's economy and delivers world-class services to both indigenous and global tourists (Kokt & Solomons, 2021). The participation of students in WIL initiatives in the hospitality produces knowledge acquisition skills about the industry as well as a way of dealing with negative situations (Nguyen, Goh & Murillo, 2023). The hospitality industry places a significant emphasis on practical skills and real-world experience, making WIL an essential component of education in this field (Patiar et al., 2021). There is a substantial value offered by WIL to hospitality students.

However, the hospitality work environment has long been renowned for being a stressful environment (Ramgoolam-Atchiamith et al., 2022). Some students perceive WIL as a disruption to their academic schedule and also worry about balancing work and study obligations (Bowen, 2020). Nguyen et al. (2023) also found that conflicting matters with immediate managers and associates is another challenge that is experienced by hospitality students. Understanding these concerns from the perspective of the students is critical in ensuring that WIL programmes are effective and efficient. The exposure to authentic hospitality environments can help them develop skills that are directly applicable to their future careers.

Even though several studies have investigated on WIL strategies, models, implementation and motivation, limited research has been conducted to understand the perceptions of students in the hospitality sector focusing on the skills development imperative. One of the obstacles which hinder students that have graduated from finding employment is the requirement by employers for some kind of work experience and practical 'on-the-job' understanding not only a qualification from university (Lubbe & Svensson, 2022). This article notes the knowledge gap on in-depth qualitative exploration of students' perceptions regarding aspects perceived skills prerequisites and non-negotiable aspect of developing skills in hospitality students. The perceptions of hospitality students about WIL as a skills development imperative provide insight into how students studying hospitality view the integration of practical work experience with their academic learning. Therefore, the main objectives of this study are to understand the perceptions of hospitality students regarding the importance and value of WIL as a means of developing skills relevant to the hospitality industry; and determine the challenges associated with WIL in shaping their skill sets.

LITERATURE REVIEW

WIL can contribute towards practical skills development. WIL allows students to gain hands-on experience in various aspects of the tourism and hospitality industry, such as customer service, event management, food and beverage operations and hotel management (Dhevabanchachai & Wattanacharoensil, 2017). By working in real-life scenarios, students can develop practical skills that are essential for success in their future careers.

Industry exposure is another significant benefit of WIL. Through WIL placements in tourism and hospitality organisations, students are exposed to the inner workings of the industry (Sonnenschein, Barker & Hibbins, 2019). Students are able to observe how different businesses operate, understand industry trends, and learn about the challenges and opportunities that the sector experiences (Caldicott, Wilson, Donnelly & Edelheim, 2020). This exposure helps them become better prepared for the demands of the industry upon graduation.

WIL also helps students with networking opportunities. During their WIL experiences, students have the chance to interact with industry professionals, managers, and executives (Hodges & Martin, 2020). Building a professional network can open doors to future job opportunities, internships, and mentorship, which can significantly impact their career trajectory.

Another essential contribution provided by WIL to students is problem-solving and adaptability. Working in real-world situations often involves facing unexpected challenges (Brewer, Lewis & Ferns, 2022). Therefore, WIL helps students develop problem-solving skills and adaptability by requiring them to think on their feet and find creative solutions to industry-specific issues.

WIL also ensures that it assists students to build confidence and work ethic. WIL experiences can boost students' confidence in their abilities and work ethic (Arney, 2022). When students participate in WIL, they engage in meaningful work and receiving positive feedback from supervisors and colleagues which can enhance their self-belief as well as motivate them.

Furthermore, WIL also increases employability. Graduates with WIL experience are often more attractive to employers due to their industry-specific skills and relevant experience in the tourism and hospitality industry (Hewitt & Sao Joao, 2022). This experience can provide students that have graduated with an advantage in the job market within the tourism and hospitality industry.

The other contribution of WIL is feedback and reflective learning. WIL experiences often involve feedback sessions with supervisors and mentors (Nisbet, Haw & Caldicott, 2022). Such feedback and opportunities for reflective learning enable students to identify areas for improvement and set goals for their professional development within the tourism and hospitality industry.

WIL can also ensures long-term industry opportunities. Many students who excel during their WIL placements may be offered full-time positions or internships by the host organisations (Pham & Jackson, 2020). WIL provides insight into employment within the tourism and hospitality industry.

METHODOLOGY

The study uses a qualitative research approach and interpretivist research paradigm. The qualitative approach meant the study utilised a sample of 15 hospitality students from Walter Sisulu University. To select the sample, participants were chosen through purposive sampling. Participants were selected from students that are registered for a tourism and hospitality course; hence, their perceptions concerning WIL were important in understanding its usefulness of WIL as a skills development imperative. The sample included both male and female student participants. The study's primary data were collected using semi-structured interviews. The data collection technique was chosen as the appropriate because it allowed the researcher to go deep to unearth and elicit insightful information about the participants' experiences (Magaldi & Berler, 2020). The interviews were approximately 20 minutes each, and consent was sought from participants before they partook in the interviews. The study followed research ethical consideration ensuring informed consent, voluntary participation, anonymity, confidentiality and no harm to participants. The collected data through interviews were transcribed and presented thematically with themes used as discussion for issues on skills development imperative.

FINDINGS AND DISCUSSION

This study's findings are presented and discussed according to emerging themes that are in line with the main objectives of this study. The main themes that emerged from the study are perceived skills priority; advancement of soft and hard skills; importance of theoretical knowledge and practical application; enhancement of confidence, adaptability and problem-solving abilities; understanding workplace complexity; employability prospects and cultivate opportunity networks. Furthermore, the thematically presentation shows that poor guidance during WIL placements, and managing academic commitments alongside practical training as challenges affecting WIL.

Perceived skills priority

This study's findings reveal that WIL assists students in the hospitality sector to have clarity on skills priority, both hard and soft skills. Essentially, this study's data indicate that hospitality sector students perceive WIL as a platform to determine indispensable skills within the hospitality sector. These skills which are a prerequisite in advancing a career in the hospitality sector for both soft and hard skills. The prominent soft skills that perceived as imperative in the hospitality sector include professional etiquette, emotional intelligence, creativity, communication and active listening. The hard skills necessary in qualification, culinary, beverage and food management, digital competencies, event management, bartending, front desk operations, housekeeping and concierge. One of the participants that responded in this study said:

There are a lot of skills that you acquire from hands-on experience of WIL such as the culinary, politeness, using the computer, budget, housekeeping, cleaning, stock management as in food and drinks that are available…. After WIL you surely can pinpoint areas that can help you advance your career in the hospitality sector.

Another participant retorted that:

The WIL initiative allows to know the skills we can prioritise in order to advance our careers. These skills become clearer when using them in real life situations such as emotional intelligence, creativity and active listening. Hospitality sector is predicated on customer service therefore aspects of communication are critical.

The findings recognised WIL as an indispensable pathway for acquiring hands-on experience as well as gaining more clarity on skills which are a development imperative in their hospitality career. This finding confirms the postulations by Dhevabanchachai and Wattanacharoensil (2017) that WIL offers hands on experience. This study's findings further show that the balance between soft and hard skills is fostered by participation in WIL.

Advancement of soft and hard skills

Part of the research findings showed that the benefits of WIL include advancement of soft and hard skills. The study discovered that WIL offers students a platform to develop their skills in a real-world work setting, helping them become more job-ready when they graduate. Soft skills advancement is usually overlooked as it is not

incorporated in most academic curriculum. Soft skills are critical in the hospitality sector because personalised and experiential customer service are necessary for the sector's success. Since soft skills are not necessarily included in the curriculum, WIL provides hospitality students with a platform to advance their soft skills. WIL also offers these students an opportunity to utilise and advance hard skills that have been acquired from their academic qualification. One participant that expressed this view stated that:

I think we benefit a lot from this WIL program in many ways. We get to improve our skills like how to talk to clients, solve a problem in a nice manner, listening and work with others. The working also helps to utilise and advance the skills that we get from our classes such as digital skills, culinary, food and beverage management.

The excerpt above points to a key theme in this study which is the advancement of soft and hard skills. WIL as a skills development imperative allows students' involvement in work tasks and duties that are relevant to different aspects of the hospitality sector.

Importance of theoretical knowledge and practical application

The importance of theoretical knowledge and practical application of acquired academic knowledge is also another substantial element that was raised by the participants. The use of theoretical knowledge in practical situation helps students understand the work environment. WIL bridges the gap between academic learning and the skills required in a professional setting. WIL ensures skills development by offering practical experience for students to use their academic knowledge in preparation of the entrance and progression in the hospitality work environment. One student that was interviewed mentioned that:

WIL ensure that we put to practice things that we learn in class. The ability to use things that you have learnt into practice is interesting and illuminating. I think you start understanding your career path after a practical.

Another student who shared a view which was different said that:

I like practical application of academic knowledge that we get from WIL. But I find that most of the superiors allocate us tasks and duties that I feel do not really benefit us because it is mostly the low skilled tasks such as cleaning and carrying things. For me it feels like we just cheap labour for some of these businesses.

The assertions above by the student show that WIL plays a significant role in bridging the gap between theoretical knowledge and practical application. However, some of students also pointed out the lack of meaningful work during WIL undermines the much needed skills development acquisition. This finding departs from the general conception that through WIL students are always obtaining a meaningful platform to bridge the gap academic knowledge and practical application. Essentially, the extent of efficiency WIL in skills development differs with specific cases and on the implementation of WIL.

Enhancement of confidence, adaptability and problem-solving abilities

Another theme that emerged in this study was the enhancement of confidence, adaptability and problem-solving abilities. WIL is enabling the integration of theoretical and practical knowledge which improves the students'

confidence in their ability to carry out duties and tasks in a professional setting. WIL also affords students a chance to deal with work issues in real-life enabling them to learn how to adapt when they are in work environment. The real-life situations in the workplace ensure that students are able to solve problems and deal with any challenges as they occur. A participant that provided an insight into this perspective remarked that:

WIL has been significant in improving so many things in my life. WIL boosts our confidence as student as we get to know about our abilities, making us more self-assured when entering the job market. Also dealing with different situations when working requires us to use our minds thinking about the things that we learnt in academic. Then sometimes you don't use the academic knowledge but you have solve the problem.

Participants expressed a heightened sense of confidence, adaptability and problem-solving abilities gained through WIL experiences. The finding confirms the findings of Arney (2022) who emphasizes the improvement of confidence among students who participate in WIL. However, this study also found that there are complimentary elements such as adaptability and problem-solving skills which become a skills development imperative when hospitality students participate in WIL. Additionally, WIL provides mental readiness in preparation to how students deal with challenges when working in a hospitality sector workplace.

Understanding workplace complexity

A finding which also forms a major theme in this study is understanding workplace complexity. The students revealed that through WIL they were able to get a deeper understanding of workplace dynamics. Their understanding of different processes and structures within an organisation help students to comprehend the relevance of particular academic courses, tasks, workload management, trends, complications and changing demands within the hospitality sector. This comprehensive picture of the workplace complexity is crucial in career readiness, motivation, required skills and skills development imperative in the hospitality sector. Explaining this perception on understanding workplace complexity, one student stated that:

WIL has been very instrumental in the understanding of the workplace. We all want to work but what I have noticed through WIL is the workplace is a very difficult place. Everything is complicated and sometime different from you thought. Things change and you have to adjust to do the tasks you have been assigned by your supervisor.

An additional supporting view from another student revealed that:

I think the practical done through WIL has shown me that the hospitality sector is very complicated. Also you need to know what to do, the hospitality sector is demanding. There is lot of work. But in all that you need to know if you want to be work in it and what skills you need to advance.

The excerpts indicate that WIL helps students to understand the complexity of the work environment. The different dynamics which make up the work environment are part of what students become acquainted to during shaping their skills helping the students to be successful in their future careers within the hospitality sector. The exposure to the complexity of the workplace enables the students to establish the skills which help them to deal with variety of complex situations in the hospitality sector.

Employability prospects

Moreover, the study also identified the employability prospect provided participating in WIL is significance to hospitality students. This study's findings reveal that through WIL students get practical experience, enhancing their hospitality industry-specific skills and also obtain opportunities to develop essential skills, making these students more attractive candidates to potential employers. One participant who held this view remarked that:

Generally, WIL can be regarded as first layer for any student to get a job. With all the experience that you get from WIL you are able to mention to an organisation that you have some form of work experience which increases the prospect of being employed.

The statement from the student proves that WIL provides students with a foundation to get into the job market. This finding corroborates the finding of Hewitt and Sao Joao (2022) who mention that WIL makes students attractive to potential organisations. Essentially, WIL provides a competitive edge as it makes student stand out among other applicants with solely academic qualifications. The necessary skills development become easier when the student has been exposed to a work environment.

Cultivate opportunity networks

The cultivation of industry networks is also part of WIL outcomes. As student take part in WIL they interact with industry professionals, mentors and colleagues. In the process of interacting they build connections that can lead to job referrals, recommendations and even job offers upon graduation. The necessity of such exposure to networks through WIL makes WIL a skills development imperative. A student sharing the importance of cultivating industry networks through WIL said:

The period when doing WIL, there is a lot that a student gets such as information on the prospective organisations that align with one's passion and desire.

Adding to this view, one student commented that:

You get meet with so many people and share information which is good for your career.

The views of the students based on their experience is that WIL as skills development imperative provides a cultivation of industry networks and prospective career opportunities. The results of this study affirm the argument by Pham and Jackson (2020) that some students get employment networks from WIL and those that excel get job opportunities. Significantly, WIL is valuable as a skills development imperative as it ensure that a student has starting point when looking for employment opportunity by providing industry networking opportunities.

Challenges

The challenges that make it difficult for WIL to become a skills development imperative in the hospitality sector vary.

Poor guidance during WIL placements

This study found that there is need for poor guidance during WIL placements. The study found that due to poor guidance some students fail to obtain optimal learning experience from WI. As a result of poor guidance, students also fail to maximise on engagement and participate in work related issues. One participant explained that:

We often experience different instructions sometimes we end up being confused. Some students end up finishing the placement more confused without gaining a lot from the programme.

Clearly, there is need for proper guidance during WIL placements. The lack of proper and adequate guidance during WIL affects the skills development process among students in the hospitality sector.

Managing academic commitments alongside practical training

The ability to strike a balance between academic commitments and WIL work requirements can be challenging for some students. The academic tasks can be demanding for students. Adding work demands to this academic workload can be overwhelming resulting in academic stress. The students also face challenges if their tasks during the placement do not align with their expectations or academic focus, leading to a disconnect between their studies and the practical experience. Meeting the expectations of the academic supervisors and work supervisors can be stressful and challenging. A student expressed this concern stating that:

We sometimes struggle with balancing schoolwork and practical training. The demands can be overwhelming sometimes. The workload becomes too much that we would always get tired. The expectations from the lecturers and work supervisor can sometimes clash.

From the excerpt it is clear that WIL can be a strain on students. The complexity of balancing work and academic responsibilities causes some students to struggle and in some cases lose focus on their academic work.

CONCLUSIONS

The article concludes that one of the perceptions of hospitality students about WIL as a skills development imperative is that WIL promotes perceived skills priority. Both hard and soft skills are part of the skills which are perceived to be a priority in hospitality sector. The students also deem advancement of hard and soft skills as a valuable aspect fostered by WIL. The advancement of these soft and hard skills is perceived to play a major role in their future career path development. Furthermore, from the findings it can be concluded that WIL bridges the gap between theoretical knowledge and practical application. However, the efficiency of bridging this gap between theoretical knowledge and practical application varies and largely depends on how WIL is implemented in a particular organisation. WIL provides students with sense of confidence, adaptability and problem-solving capabilities. This exposure to work provided by WIL prepares hospitality students for the complexity of the hospitality work environment. The participation in WIL is also perceived to improve employability prospects. Additionally, WIL also assists students to build networks that help them get career opportunities. Even though the hospitality students largely perceive WIL as a skills development imperative,

there are challenges that undermine participation in WIL. The challenges are poor guidance during WIL and managing a balance between academic commitments and WIL training requirements. Essentially, this article highlights that the importance and value of WIL as perceived by hospitality students making it a skills development imperative. Hospitality students perceive WIL as a way to align their education with the actual needs of the industry.

LIMITATIONS AND FURTHER RESEARCH

The study utilises the qualitative research approach which has limitations such as the use of a small sample size. The small sample provided in-depth insightful data necessary in understanding the perceptions of the hospitality students on WIL as a skills development imperative. However, another study with a bigger sample size which uses a quantitative research approach can be conducted to understand the dynamics that affect WIL among students of different academic levels and institutions. This study is limited to a certain academic discipline in its assessment of WIL as a skills development imperative more studies can be carried to find out about issues that undermine the use of WIL in other academic disciplines.

TOURISM AND CLIMATE CHANGE: WHAT ARE THE IMPLICATIONS FOR THE UN 2030 AGENDA?

Gaunette M Sinclair-Maragh

University of Technology, Jamaica

Abstract

The Sustainable Development Goal (SDG) 13 is a call by the United Nations Assembly to pay particular attention to the 5Ps of people, planet, prosperity, peace and partnership by way of taking urgent action to combat climate change and its impacts. The climatic condition of a destination is a very important resource for tourism and therefore, this industry has to pay great attention to the phenomenon of climate change. This study therefore, seeks to phenomenologically analyse how the tourism industry and its sub sectors can play an integral role in effective climate action amidst the predicted growth of the industry in realization of SDG13 to limit and adapt to climate change for 2030.

THE IMPACT OF RISK ON INBOUND TOURISM: THE CASE OF MAURITIUS

Kilvanee Mootooperian

University of Mauritius

Narvada Gopy

University of Mauritius

Boopen Seetanah

University of Mauritius

ABSTRACT

The importance of the tourism sector over the past few decades has increased significantly. Previous studies focused on the importance of inbound tourism in its promotion towards economic development and positively impacting the living standard of a population. The dependence of the tourism sector as a crucial pillar of the Mauritian economy remains a sine qua non for its balance of payment as well as contributes to the overall evolution of the country. This study investigates the impact of risk on inbound tourism in the context of Mauritius by combining the different types of risks (economic, financial and political). In the first instance, the Principal Component Analysis (PCA) will be employed for the generation of a political risk index, a financial risk index and an economic risk index as well as a comprehensive country risk index for Mauritius. The risk and tourism nexus will then be explored using a dynamic time series approach with annual data covering the period 1980 to 2022. In particular, an econometric model will be used to capture this link in both the short-run and long run. Moreover, the existence of potential asymmetric effects of risk on inbound tourism will also be rigorously tested. The findings from this analysis are expected to have important implications for policymakers in their quest to attract tourists in the country. The findings can help to better monitor the level of uncertainties and develop appropriate strategies to mitigate the effect of risk to attract the arrival of visitors. The expected results are also judged to have interesting theoretical contributions to the field.

ANTECEDENTS OF ARTIFICIAL INTELLIGENCE ADOPTION IN SUSTAINABLE TOURISM

Modjadji Matilda Mashapa
University of Johannesburg
School of Tourism and Hospitality
Email: mmashapa@uj.ac.za

Robin Nunkoo
University of Mauritius
Department of Management
Email: r.nunkoo@uom.ac.mu

Abstract

Artificial intelligence (AI) has attracted considerable attention in recent years, particularly in the context of sustainable tourism. As the tourism business continues to develop, the relevance of AI applications in this area has increased significantly. AI technologies integrated into sustainable tourism practices can increase operational efficiency, improve the guest experience, and contribute to the overall sustainability of tourism operations. However, the adoption of AI also brings with it obstacles and subtleties that need to be examined and understood in detail. This research aims to bridge this gap by investigating the factors that contribute to the adoption of AI in sustainable tourism among South African tourism organisations. Despite several studies on AI's adoption in the tourism sector, there is a lack of thorough research that explicitly examines the antecedents influencing the adoption of AI in sustainable tourism. Drawing on the Technology Threat and Avoidance Theory (TTAT) and Expectancy Confirmation Model (ECM), the study followed a quantitative methodology and cross-sectional research methods to collect data from 1049 tourism employees. Data were then analyzed using the Smart PLS 4 computer software. The results suggest that user satisfaction may be more critical in overcoming perceived threats and driving AI adoption than management support. These findings imply that satisfied users with validated expectations may be more willing to accept the risks and uncertainties associated with AI technologies, even without strong management support. As a result, this study offers new insights and a research agenda for academics, managers and policy makers in implementing effective AI adoption in sustainable tourism.

Keywords: AI, adoption, sustainable tourism, ECM, TTAT
